▼B**COUNCIL DIRECTIVE****of 27 July 1976****on the approximation of the laws of the Member States relating to the installation of lighting and light-signalling devices on motor vehicles and their trailers**

(76/756/EEC)

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 100 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Parliament ⁽¹⁾,Having regard to the opinion of the Economic and Social Committee ⁽²⁾,Whereas the technical requirements which motor vehicles must satisfy pursuant to national laws relate *inter alia* to the installation of lighting and light-signalling devices;Whereas those requirements differ from one Member State to another; whereas it is therefore necessary that all Member States adopt the same requirements either in addition to or in place of their existing rules, in order, in particular, to allow the EEC type-approval procedure which was the subject of Council Directive 70/156/EEC of 6 February 1970 on the approximation of the laws of the Member States relating to the type-approval of motor vehicles and their trailers ⁽³⁾, to be introduced in respect of each type of vehicle;

Whereas common requirements for the construction of lighting and light-signalling devices will be the subject of further special Directives;

Whereas approximation of the national laws relating to motor vehicles entails mutual recognition by the Member States of the checks carried out by each of them on the basis of the common requirements; whereas, if the system is to function properly, these requirements must be applied from the same date,

HAS ADOPTED THIS DIRECTIVE:

▼M3*Article 1*

For the purposes of this Directive, 'vehicle' means any motor vehicle intended for use on the road, with or without bodywork, having at least four wheels and a maximum design speed exceeding 25 kilometres per hours, and its trailers, with the exception of vehicles which run on rails, agricultural or forestry tractors and machinery, and public-works vehicles.

Article 2

1. No Member State may:

- refuse, in respect of a type of vehicle, to grant EEC type-approval or national type-approval, or
- refuse or prohibit the sale, registration, entry into service or use of vehicles,

on grounds relating to the installation on the vehicles of the lighting and light-signalling devices, whether mandatory or optional, listed in

⁽¹⁾ OJ No C 55, 13. 5. 1974, p. 14.⁽²⁾ OJ No C 109, 19. 9. 1974, p. 22.⁽³⁾ OJ No L 42, 23. 2. 1970, p. 1.

▼ **M3**

items 1.5.7 to 1.5.20 of Annex I if these devices are installed in accordance with the requirements set out in Annex I.

2. By way of derogation from paragraph 1, compliance with the provisions of item 4.2.6 of Annex I shall be required only with effect from 1 October 1984. However, where devices such as those referred to in item 4.2.6.2 are installed before that date, they must satisfy the requirements set out in item 4.2.6. Where EEC type-approval (or the issue of the document referred to in the last indent of Article 10 (1) of Directive 70/156/EEC) or national type-approval was granted after 1 October 1979 and before 1 October 1984 in respect of a vehicle type that does not comply with the requirements referred to in paragraph 1, Member States may prohibit the first entry into service of vehicles of that type with effect from 1 October 1987.

Article 3

A Member State which has granted EEC type-approval shall take the necessary measures to ensure that it is informed of any modification to any of the parts or characteristics referred to in item 1.1 of Annex I. The competent authorities of that Member State shall determine whether further tests should be carried out on the modified vehicle type and a fresh report drawn up. Where such tests reveal failure to comply with the requirements of this Directive, the modification shall not be approved.

Article 4

Any amendments necessary in order to adjust the content of the Annexes to take account of technical progress shall be adopted in accordance with the procedure laid down in Article 13 of Directive 70/156/EEC.

Article 5

1. Member States shall bring into force the provisions necessary in order to comply with this Directive not later than 1 October 1983. They shall forthwith inform the Commission thereof.

2. Once this Directive has been notified to the Member States⁽¹⁾ they shall ensure that the Commission is informed, in sufficient time to enable it to submit its comments, of any draft laws, regulations or administrative provisions which they intend to adopt in the field covered by this Directive.

▼ **B***Article ► **M1** 6 ◀*

This Directive is addressed to the Member States.

⁽¹⁾ This Directive was notified to the Member States on 1 June 1983.

▼B*ANNEX I***INSTALLATION OF LIGHTING AND LIGHT-SIGNALLING DEVICES**

1. DEFINITIONS

For the purposes of this Directive:

▼M21.1. **Vehicle type with regard to the installation of lighting and light-signalling devices**

Vehicle type with regard to the installation of lighting and light-signalling devices means vehicles which do not differ in the essential respects mentioned in Items 1.1.1 - 1.1.4.

The following are likewise considered not to be 'vehicles of a different type': vehicles which differ within the meaning of Items 1.1.1 - 1.1.4, but not in such a way as to entail a change in the type, number, positioning and geometric visibility of the lamps and the inclination of the dipped beam prescribed for the vehicle type in question, and vehicles on which optional lamps are fitted or are absent.

▼B

1.1.2. the number and positioning of the devices;

1.1.2. the number and positioning of the devices;

the following are likewise considered not to be 'vehicles of a different type': vehicles which differ within the meaning of 1.1.1 and 1.1.2 but not in such a way as to entail a change in the type, number, positioning and geometric visibility of the lamps prescribed for the vehicle type in question, and vehicles on which optional lamps are fitted or are absent;

▼M2

1.1.3. the headlamp levelling system;

1.1.4. the suspension system.

▼B1.2. **Transverse plane**

'Transverse plane' means a vertical plane perpendicular to the median longitudinal plane of the vehicle.

▼M11.3. **Unladen vehicle**

'Unladen vehicle' means the vehicle in running order, as defined in item 2.6 of Annex I, model information document, to Directive 70/156/EEC, but without driver.

▼B1.4. **Laden vehicle**

'Laden vehicle' means the vehicle loaded to its technically permissible maximum weight, as stated by the manufacturer, who shall also fix the distribution of this weight between the axles in accordance with the method described in Appendix 1.

1.5. **Lamp**

'Lamp' means a device designed to illuminate the road (head-lamp) or to emit a light signal. Rear registration plate lamps and reflex reflectors shall likewise be regarded as lamps.

1.5.1. *Equivalent lamps*

'Equivalent lamps' means lamps having the same function and authorized in the country in which the vehicle is registered; such lamps may have different characteristics from those installed on the vehicle when it is approved on condition that they satisfy the requirements of this Annex.

▼B1.5.2. *Independent lamps*

‘Independent lamps’ means lamps having separate lenses, separate light sources and separate lamp bodies.

▼M11.5.3. *Grouped lamps*

‘Grouped lamps’ means devices having separate lenses or separate parts of lenses, separate light sources, but a common lamp body.

1.5.4. *Combined lamps*

‘Combined lamps’ means devices having separate lenses or separate parts of lenses, but a common light source and a common lamp body.

▼B1.5.5. *Reciprocally incorporated lamps*

‘Reciprocally incorporated lamps’ means devices having separate light sources (or a single light source operating under different conditions), totally or partially common lenses and a common lamp body.

1.5.6. *Concealable illuminating lamp*

‘Concealable illuminating lamp’ means a headlamp capable of being partly or completely hidden when not in use. This result may be achieved by means of a movable cover, by displacement of the headlamp or by any other suitable means. The term ‘retractable’ is used more particularly to describe a concealable lamp the displacement of which enables it to be inserted within the bodywork.

1.5.7. *Main-beam headlamp*

‘Main-beam headlamp’ means the lamp used to illuminate the road over a long distance ahead of the vehicle.

1.5.8. *Dipped-beam headlamp*

‘Dipped-Beam headlamp’ means the lamp used to illuminate the road ahead of the vehicle without causing undue dazzle or discomfort to oncoming drivers and other road-users.

1.5.9. *Front fog lamp*

‘Front fog lamp’ means the lamp used to improve the illumination of the road in case of fog, snowfall, rainstorms or dust clouds.

1.5.10. *Reversing lamp*

‘Reversing lamp’ means the lamp used to illuminate the road to the rear of the vehicle and to warn other road-users that the vehicle is reversing or about to reverse.

1.5.11. *Direction indicator lamp*

‘Direction indicator lamp’ means the lamp used to indicate to other road-users that the driver intends to change direction to the right or to the left.

1.5.12. *Hazard warning signal*

‘Hazard warning signal’ means the simultaneous operation of all of a vehicle's direction indicator lamps to draw attention to the fact that the vehicle temporarily constitutes a special danger to other road-users.

1.5.13. *Stop lamp*

‘Stop lamp’ means the lamp used to indicate to other road-users to the rear of the vehicle that the latter's driver is applying the service brake.

▼B

- 1.5.14. *Rear registration plate lamp*
 ‘Rear registration plate lamp’ means the device used to illuminate the space intended to accommodate the rear registration plate; it may consist of different optical elements.
- 1.5.15. *Front position (side) lamp*
 ‘Front position (side) lamp’ means the lamp used to indicate the presence and the width of the vehicle when the latter is viewed from the front.
- 1.5.16. *Rear position (side) lamp*
 ‘Rear position (side) lamp’ means the lamp used to indicate the presence and the width of the vehicle when the latter is viewed from the rear.
- 1.5.17. *Rear fog lamp*
 ‘Rear fog lamp’ means the lamp used to render the vehicle more readily visible from the rear in dense fog.
- 1.5.18. *Parking lamp*
 ‘Parking lamp’ means the lamp used to draw attention to the presence of a stationary vehicle in a built-up area. In such circumstances it replaces the front and rear position (side) lamps.
- 1.5.19. *End-outline marker lamp*
 ‘End-outline marker lamp’ means the lamps fitted to the extreme outer edge as close as possible to the top of the vehicle and intended clearly to indicate the vehicle's overall width. This signal is intended, for certain vehicles and trailers, to complement the vehicle's front and rear position (side) lamps by drawing particular attention to its bulk.

▼M1

- 1.5.20. *Reflex reflector*
 ‘Reflex reflector’ means a device used to indicate the presence of a vehicle by the reflection of light emanating from a light source not connected to the vehicle, the observer being situated near the source.
- For the purposes of this Directive the following are not considered as reflex reflectors:
- retro-reflecting number plates,
 - the retro-reflecting signals mentioned in the ADR (European Agreement concerning the international carriage of dangerous goods by road),
 - other retro-reflecting plates and signals which must be used to comply with a Member State's specifications for use as regards certain categories of vehicles or certain methods of operation.

▼B1.6. **Illuminating surface of a lamp****▼M1**

- 1.6.1. *Illuminating surface of a lighting device*
 ‘Illuminating surface of a lighting device’ (1.5.7 to 1.5.10) means the orthogonal projection of the full aperture of the reflector in a transverse plane. If the lighting device has no reflector, the definition of item 1.6.2 shall be applied. If the lamp glass (or glasses) extend(s) over part only of the full aperture of the reflector, then the projection of that part only is taken into account.
- In the case of a dipped-beam headlamp, the illuminating surface is limited by the apparent trace of the cut-off on to the lens. If the reflector and glass are adjustable relative to one another, the mean adjustment should be used.

▼B

- 1.6.2. *Illuminating surface of a signalling lamp other than a reflex reflector*
 ‘Illuminating surface of a signalling lamp other than a reflex reflector’ (1.5.11 to 1.5.19) means the orthogonal projection of

▼B

the lamp in a plane perpendicular to its axis of reference and in contact with the exterior light-emitting surface of the lamp, this projection being bounded by the edges of screens situated in this plane, each allowing only 98% of the total luminous intensity of the light to persist in the direction of the axis of reference. To determine the lower, upper and lateral limits of the illuminating surface, only screens with horizontal or vertical edges shall be used.

1.6.3. *Illuminating surface of a reflex reflector*

‘Illuminating surface of a reflex reflector’ (1.5.20) means the illuminating surface of a reflex reflector in a plane perpendicular to the axis of reference and bounded by planes touching the outer edges of the light projection surface of the reflex reflector and parallel to this axis. To determine the lower, upper and lateral limits of the illuminating surface, only vertical and horizontal planes shall be used.

▼M11.6.4. *Apparent surface*

‘Apparent surface’, for a defined direction of observation, means the orthogonal projection of the light-emitting surface in a plane perpendicular to the direction of observation (see drawing in Appendix 2) and tangential to the most exterior point of the lens.

1.6.5. *Light-emitting surface*

‘Light-emitting surface’ means all or part of the exterior surface of the transparent lens that encloses ►C1 the lighting or light-signalling device ◀ and allows compliance with photometric and colorimetric requirements.

▼B1.7. **Axis of reference**

‘Axis of reference’ means the characteristic axis of the light signal, determined by the manufacturer for use as the direction of reference ($H = 0^\circ$, $V = 0^\circ$) for photometric measurements and when fitting the lamp on the vehicle.

▼M11.8. **Centre of reference**

‘Centre of reference’ means the intersection of the axis of reference with the light-emitting surface. This centre of reference is to be specified by the manufacturer of the lamp.

1.9. **Angles of geometric visibility**

‘Angles of geometric visibility’ means the angles which determine the field of the minimum solid angle in which the apparent surface of the lamp must be visible. That field of the solid angle is determined by the segments of the sphere of which the centre coincides with the centre of reference of the lamp and the equator is parallel with the ground. These segments are determined in relation to the axis of reference. The horizontal angles β correspond to the longitude and the vertical angles α to the latitude. There must be no obstacle on the inside of the angles of geometric visibility to the propagation of light from any part of the apparent surface of the lamp observed from infinity.

If measurements are taken closer to the lamp, the direction of observation must be shifted parallel to achieve the same accuracy.

On the inside of the angles of geometric visibility no account is taken of obstacles, if they were already presented when the lamp was type-approved.

If, when the lamp is installed, any part of the apparent surface of the lamp is hidden by any further parts of the vehicle, proof shall be furnished that the part of the lamp not hidden by obstacles still conforms to the photometric values prescribed for the approval of the device as an optical unit (see figure below).

▼ M1▼ B1.10. **Extreme outer edge**

'Extreme outer edge' on either side of the vehicle means the plane parallel with the median longitudinal plane of the vehicle and coinciding with its lateral outer edge, disregarding the projection:

- 1.10.1. of tyres near their point of contact with the ground, and connections for tyre-pressure gauges;
- 1.10.2. of any anti-skid devices which may be mounted on the wheels;
- 1.10.3. of rear-view mirrors;

▼ M2

- 1.10.4. of side direction indicator lamps, end-outline marker lamps, front and rear position (side) lamps, parking lamps and reflex reflectors;

▼ B

- 1.10.5. of customs seals affixed to the vehicle, and devices for securing and protecting such seals.

1.11. **Overall width**

'Overall width' means the distance between the two vertical planes defined in 1.10.

▼ M11.12. **A single lamp**

'A single lamp' also means any combination of two or more lamps, whether identical or not, having the same function and emitting light of the same colour, if it comprises devices, the projection of whose aggregate illuminating surfaces in a given transverse plane occupies 60 % or more of the area of the smallest rectangle circumscribing the projections of those illuminating surfaces, provided that such combination is, where approval is required, approved as a single lamp.

▼ M1

This possible combination does not apply to main-beam headlamps, dipped-beam headlamps and front fog lamps.

▼ B1.13. **Two lamps or an even number of lamps**

‘Two lamps’ or ‘an even number of lamps’ means a single ► M1 ► C1 illuminating surface ◀ ◀ in the shape of a band if placed symmetrically in relation to the median longitudinal plane of the vehicle and extending on both sides to within not less than 400 mm of the extreme outer edge of the vehicle, and being not less than 800 mm long. The illumination of such a surface shall be provided by not less than two light sources placed as close as possible to its ends. The ► M1 ► C1 illuminating surface ◀ ◀ may be constituted by a number of juxtaposed elements on condition that the projections of the several individual ► M1 ► C1 illuminating surfaces ◀ ◀ on the same transverse plane occupy not less than 60% of the area of the smallest rectangle circumscribing the projections of those individual ► M1 ► C1 illuminating surfaces ◀ ◀.

▼ M11.14. **Distance between two lamps**

‘Distance between two lamps’ which face in the same direction means the shortest distance between the orthogonal projections in a plane perpendicular to the axes of reference of the outlines of the two illuminating surfaces as defined according to the case mentioned in 1.6. The distance between two lamps may, however, be measured without determining the outlines of the illuminating surfaces exactly, where the distance is clearly in excess of the minimum requirements of the Directive.

▼ B1.15. **Optional lamp**

‘Optional lamp’ means a lamp the presence of which is left of the discretion of the manufacturer.

1.16. **Operational tell-tale**

‘Operational tell-tale’ means a light or auditory device showing whether a device that has been actuated is operating correctly or not.

1.17. **Circuit-closed tell-tale**

‘Circuit-closed tell-tale’ means a light showing that a device has been switched on but not showing whether it is operating correctly or not.

▼ M11.18. **Ground**

‘Ground’ means the surface on which the vehicle stands which should be substantially horizontal.

▼ B

2. APPLICATION FOR EEC TYPE-APPROVAL

2.1. The application for EEC approval of a vehicle type with regard to the installation of its lighting and light-signalling devices shall be submitted by the vehicle manufacturer or his representative.

2.2. It shall be accompanied by the following documents in triplicate, and by the following particulars:

2.2.1. a description of the vehicle type in accordance with the points listed in 1.1, together with the restrictions on loading, particularly the maximum permissible load in the boot;

▼ M1

2.2.2. a list of devices prescribed by the manufacturer for the lighting and light-signalling assembly. The list may include several types of device for each operation. Each type must be duly identified (component type-approval mark, name of manufacturer, etc.);

▼B

- 2.2.3. layout drawing of the lighting and light-signalling equipment as a whole, showing the position of the various lamps on the vehicle;

▼M2

- 2.2.4. lay out drawing(s) for each individual lamp showing the illuminating surfaces as defined in Item 1.6, the axis of reference as defined in Item 1.7 and the centre of reference as defined in Item 1.8.

This information is not necessary in the case of the rear registration plate lamp (Item 1.5.14).

▼B

- 2.3. An unladen vehicle fitted with lighting and light-signalling equipment as described in 2.2.2 and representative of the vehicle type to be approved, must be submitted to the technical authority conducting approval tests.
- 2.4. The document provided for in Annex II shall be attached to the type-approval document.

3. GENERAL SPECIFICATIONS

- 3.1. The lighting and light-signalling devices must be so fitted that under normal conditions of use, and notwithstanding any vibration to which they may be subjected, they retain the characteristics laid down in this Annex and enable the vehicle to comply with the requirements of this Annex. In particular, it shall not be possible for the adjustment of the lamps to be inadvertently disturbed.
- 3.2. The illuminating lamps described in 1.5.7, 1.5.8 and 1.5.9 must be so fitted that a correct setting of their alignment can easily be performed.
- 3.3. For all light-signalling devices, including those mounted on the side panels, the reference axis of the lamp when fitted to the vehicle must be parallel with the bearing plane of the vehicle on the road; in addition, it must be perpendicular to the median longitudinal plane of the vehicle in the case of side reflex reflectors and parallel to that plane in the case of all other signalling devices. In each direction a tolerance of $\pm 3^\circ$ shall be allowed. In addition, any specific instructions as regards fitting laid down by the manufacturer must be complied with.
- 3.4. In the absence of specific requirements, the height and alignment of the lamps shall be checked with the unladen vehicle placed on a flat, horizontal surface.
- 3.5. In the absence of specific requirements, lamps constituting a pair shall:

▼M1

- 3.5.1. be fitted to the vehicle symmetrically in relation to the median longitudinal plane (this estimate to be based on the exterior geometrical form of the lamp and not on the edge of its illuminating surface referred to in 1.6);
- 3.5.2. be symmetrical to one another in relation to the median longitudinal plane; this requirement is not valid with regard to the interior structure of the lamp;

▼B

- 3.5.3. satisfy the same colorimetric characteristics;
- 3.5.4. have substantially identical photometric characteristics.
- 3.6. On vehicles whose external shape is asymmetrical, the above requirements shall be satisfied as far as possible.
- 3.7. Lamps having different functions may be independent or be grouped, combined or reciprocally incorporated in one device, provided that each such lamp complies with the requirements applicable to it.

▼M1

- 3.8. The maximum height above ground shall be measured from the highest point and the minimum height from the lowest point of the illuminating surface.

In the case of dipped headlamps, the minimum height in relation to the ground is measured from the lowest edge of the reflector.

▼M1

- 3.8.1. The position, as regards width, will be determined from the edge of the illuminating surface which is the furthest from the median longitudinal plane of the vehicle when referred to the overall width, and from the inner edges of the illuminating surfaces when referred to the distance between the lamps.

▼B

- 3.9. In the absence of specific requirements no lamps other than direction indicator lamps and the hazard warning signal may emit a flashing light.

▼M1

- 3.10. No red light emitted from a lamp as defined in 1.5 shall be visible towards the front and no white light emitted from a lamp as defined in 1.5 other than from the reversing lamp shall be visible towards the rear. Lamps used to illuminate the vehicle's interior shall not be taken into consideration in this respect.

This requirement is considered to have been met if:

- 3.10.1. ►C1 for the visibility of any red light ◀ towards the front: there must be no direct visibility of a light-emitting surface of a red lamp if viewed by an observer moving within Zone 1 in a transverse plane situated 25 m in front of the vehicle (see Appendix 3, figure 1);
- 3.10.2. ►C1 for the visibility of any white light ◀ towards the rear: there must be no direct visibility of a light-emitting surface of a white lamp if viewed by an observer moving within Zone 2 in a transverse plane situated 25 m behind the vehicle (see Appendix 3, figure 2).

▼B

- 3.10.3. Zones 1 and 2, as seen by the observer, are limited in their respective planes as follows:
- 3.10.3.1. as regards height, by two horizontal planes which are 1 and 2·2 m respectively above the ground;
- 3.10.3.2. as regards width, by two vertical planes which make an angle of 15° towards the front and rear respectively, and outside the vehicle by reference to the median plane of the vehicle, passing through the point (or points) of contacts of vertical planes which are parallel with the median longitudinal plane of the vehicle, and limiting the overall width of the vehicle.

If there are several points of contact, the one which is furthest forward shall correspond to the front plane and the one furthest rearward shall correspond to the rear plane.

▼M1

- 3.11. The electrical connections must be such that the front and rear position (side) lamps, the end-outline marker lamps if they exist, and the rear registration plate lamp can only be switched on and off simultaneously.

This is not valid when using front and rear position (side) lamps as parking lamps.

▼B

- 3.12. The electrical connections must be such that the main-beam and dipped-beam headlamps, and the front and rear fog lamps cannot be switched on unless the lamps referred to in 3.11 are also switched on. This requirement shall not apply, however, to main-beam or dipped-beam headlamps when their luminous warnings consist of the intermittent lighting up at short intervals of the main-beam headlamps or the intermittent lighting up at short intervals of the dipped-beam headlamps or the alternate lighting up at short intervals of the main-beam and dipped beam headlamps.

- 3.13. The colours of the light emitted by the lamps or reflectors are as follows:

— main-beam headlamp:	white or selective yellow,
— dipped-beam headlamp:	white or selective yellow,
— front fog lamp:	white or yellow,
— reversing lamp:	white,
— direction indicator lamp:	amber,

▼B

— hazard warning signal:	amber,
— stop lamp:	red,
— rear registration plate lamp:	white,
— front position (side) lamp:	white; selective yellow is permitted if the front position (side) lamp is incorporated in a selective yellow headlamp,
— rear position (side) lamp:	red,
— rear fog lamp:	red,
— parking lamp:	white in front, red at the rear, amber if incorporated in the side direction indicator lamps,
— end-outline marker lamp:	white in front, red at the rear,
— rear reflex reflector, non-triangular:	red,
— rear reflex reflector, triangular:	red,
— front reflex reflector, non-triangular ⁽¹⁾ :	identical to incident light,
— side reflex reflector, non-triangular:	amber.

⁽¹⁾ Also known as 'white' or 'colourless' reflector.

However, as long as all the requirements necessary for obtaining EEC vehicle type-approval do not apply, the choice of the colour of the light emitted by main-beam and dipped-beam headlamps and front fog lamps shall be left to the Member States.

- 3.14. The function of the circuit-closed tell-tales may be fulfilled by operational tell-tales.
- 3.15. **Concealable lamps**
- 3.15.1. The concealment of lamps shall be prohibited, with the exception of the main-beam headlamp, the dipped-beam headlamp and the front fog lamp, which may be concealed when not in use.
- 3.15.2. An illuminating device in the position of use shall remain in that position if the malfunction referred to in 3.15.2.1 occurs alone or in conjunction with one of the malfunctions described in 3.15.2.2:
- 3.15.2.1. the absence of power for manipulating the lamp:
- 3.15.2.2. a break, impedance, or short-circuit to earth in the electrical circuit, defects in the hydraulic or pneumatic leads, Bowden cables, solenoids or other components controlling or transmitting the energy intended to activate the concealment device.

▼M1

- 3.15.3. In the event of a defect in the concealment control or other defects referred to in points 3.15.2.1 and 3.15.2.2, a concealed lighting device shall be capable of being moved into the position of use without the aid of tools.

▼B

- 3.15.4. It must be possible to move illuminating devices into the position of use and to switch them on by means of a single control, without excluding the possibility of moving them into the position of use without switching them on. However, in the case of grouped-main-beam and dipped-beam headlamps, the control referred to above is required only to activate the dipped-beam headlamps.
- 3.15.5. It must not be possible deliberately, from the driver's seat, to stop the movement of switched-on headlamps before they reach the position of use. If there is a danger of dazzling other road users by the movement of headlamps, they may light up only when they have reached their final position.

▼M1

- 3.15.6. When the concealment device has a temperature of -30 to $+50$ °C the headlamp must be capable of reaching the fully-open position within three seconds of initial operation of the control.

▼M1

- 3.16. **Number of lamps**
The number of lamps mounted on the vehicle shall be equal to the number(s) specified ►C1 in subparagraph 2 of items 4.1 to 4.17. ◀

▼B

4. INDIVIDUAL SPECIFICATIONS

4.1. **Main-beam headlamp**4.1.1. *Presence*

Mandatory on motor vehicles.
Prohibited on trailers.

4.1.2. *Number*

Two or four.

4.1.3. *Arrangement*

No individual specifications.

4.1.4. *Position*

4.1.4.1. Width:

The outer edges of the illuminating surface must in no case be closer to the extreme outer edge of the vehicle than the outer edges of the illuminating surface of the dipped-beam headlamps.

4.1.4.2. Height:

No individual specifications.

▼M1

4.1.4.3. Length:

at the front of the vehicle and fitted in such a way that the light emitted does not cause discomfort to the driver either directly or indirectly through the rear-view mirrors and/or other reflecting surfaces of the vehicles.

4.1.5. *Geometric visibility*

The visibility of the illuminating surface, including its visibility in areas which do not appear to be illuminated in the direction of observation considered, must be ensured within a divergent space defined by generating lines based on the perimeter of the illuminating surface and forming an angle of not less than 5 ° with the axis of reference of the headlamp. The origin of the angles of geometric visibility is the perimeter of the projection of the illuminating surface on a transverse plane tangent to the foremost part of the lens of the headlamp.

▼B4.1.6. *Alignment*

Towards the front.

Apart from the devices necessary to maintain correct adjustment, and when there are two pairs of headlamps, one pair, consisting of headlamps functioning as main-beam headlamps only may swivel, according to the angle of lock of the steering, about an axis very near the vertical.

4.1.7. *May be 'grouped'*

with the dipped-beam headlamp and the other front lamps.

4.1.8. *May not be 'combined'*

with any other lamp.

4.1.9. *May be 'reciprocally incorporated'*

4.1.9.1. with the dipped-beam headlamp, unless the main-beam headlamp swivels according to the angle of lock of the steering;

4.1.9.2. with the front position (side lamp);

4.1.9.3. with the front fog lamp;

4.1.9.4. with the parking lamp.

▼B

- 4.1.10. *Electrical connections*
- 4.1.10.1. The main-beam headlamps may be switched on either simultaneously or in pairs. For changing over from the dipped to the main beam at least one pair of main beams must be switched on. For changing over from the main to the dipped beam all main-beam headlamps must be switched off simultaneously.
- 4.1.10.2. The dipped beams may remain switched on at the same time as the main beams.

▼M1

- 4.1.11. *Tell-tale*
- Circuit-closed tell-tale mandatory.

▼B

- 4.1.12. *Other requirements*
- 4.1.12.1. The aggregate maximum intensity of the headlamp beams which can be switched on simultaneously must not exceed 225 000 cd.
- 4.1.12.2. This maximum intensity shall be obtained by adding together the individual maximum intensities measured at the time of component type-approval and shown on the relevant approval certificates.

4.2. Dipped-beam headlamp

- 4.2.1. *Presence*
- Mandatory on motor vehicles.
- Prohibited on trailers.
- 4.2.2. *Number*
- Two.
- 4.2.3. *Arrangement*
- No individual specifications.
- 4.2.4. *Position*
- 4.2.4.1. *Width:*
- The edge of the illuminating surface which is farthest from the vehicle's median longitudinal plane must be not more than 400 mm from the extreme outer edge of the vehicle.
- The inner edges of the illuminating surfaces must be not less than 600 mm apart.
- 4.2.4.2. *Height:*
- Above the ground: not less than 500 mm and not more than 1 200 mm.
- 4.2.4.3. *Length:*
- At the front of the vehicle; this requirement shall be regarded as satisfied if the light emitted does not cause discomfort to the driver either directly, or indirectly through the rear-view mirrors and/or other reflecting surfaces of the vehicle.

▼M1

- 4.2.5. *Geometric visibility*
- Defined by angles α and β as specified in 1.9:

α = 15 ° upwards and 10 ° downwards,

β = 45 ° outwards and 10 ° inwards.

Since the photometric values required for dipped-beam headlamps do not cover the full geometric field of vision, a minimum value of 1 cd in the space remaining is required for type-approval purposes. The presence of panels or other items of equipment near the light must not give rise to secondary effects causing discomfort to other road users.

▼B

4.2.6. *Alignment*

▼M2

4.2.6.1. After adjustment of the initial inclination, the vertical inclination of the dipped beam shall be measured in static conditions under all the loading conditions defined in Appendix 1. It shall remain between -0.5 and -2.5 % without manual adjustment. Initial adjustment shall be between -1 and -1.5 % in the 'unladen vehicle' state with one person in the driving seat. The initial adjustments for each type of vehicle must be specified by the manufacturer and must be indicated in a clearly legible and indelible manner on each vehicle close to either the headlamp or the manufacturer's plate by the symbol shown in Appendix 6.

▼B

4.2.6.2. The preceding condition may be satisfied by means of a device acting on the relative position of the headlamp and the vehicle. In the case of this device failing the beam must not return to a position less inclined downwards than its position at the time of failure of the device.

4.2.6.2.1. The device mentioned in 4.2.6.2 must be automatic.

▼M2

4.2.6.2.2. Devices which are adjusted manually, either continuously or non-continuously, shall nevertheless be permitted, provided they have a stop position at which the lamps can be returned to the initial inclination defined in Item 4.2.6.1 by means of the usual adjusting screws. These manually adjustable devices must be operable from the driving seat. Continually adjustable devices must have reference marks indicating the loading conditions that require adjustment of the dipped beam.

The number of positions on devices which are not continuously adjustable must be such as to ensure compliance, starting from an initial inclination of between -1 and 1.5 %; with the range of values between -0.5 and -2.5 % for the loading conditions defined in Appendix 1. For these devices also, the loading conditions that require adjustment of the dipped beam shall be clearly marked near the control of the device (see Appendix 7).

4.2.6.2.3. The measurement of the variation of dipped beam inclination as a function of load must be carried out in accordance with the test procedure set out in Appendix 5.

▼B

4.2.7. *May be 'grouped'*

with the main-beam headlamp and the other front lamps.

4.2.8. *May be not 'combined'*

with any other lamp.

4.2.9. *May be 'reciprocally incorporated'*

4.2.9.1. with the main-beam headlamp, unless the latter swivels according to the angle of lock of the steering;

4.2.9.2. with the other front lamps.

4.2.10. *Electrical connections*

The control for changing over to the dipped beam must switch off all main-beam headlamps simultaneously.

The dipped beams may remain switched on at the same time as the main beams.

▼M1

4.2.11. *Tell-tale*

Tell-tale optional.

▼B

4.2.12. *Other requirements*

The requirements of 3.5.2 shall not apply to dipped-beam headlamps.

▼ B

- 4.3. **Front fog lamp**
- 4.3.1. *Presence*
Optional on motor vehicles.
Prohibited on trailers.
- 4.3.2. *Number*
Two.
- 4.3.3. *Arrangement*
No individual specifications.
- 4.3.4. *Position*
- 4.3.4.1. *Width:*
The point on the illuminating surface which is farthest from the vehicle's median longitudinal plane must be not more than 400 mm from the extreme outer edge of the vehicle.
- 4.3.4.2. *Height:*
Not less than 250 mm above the ground.
No point on the illuminating surface must be higher than the highest point on the illuminating surface of the dipped-beam headlamp.
- 4.3.4.3. *Length:*
At the front of the vehicle: this requirement shall be considered to be satisfied if the light emitted does not cause discomfort to the driver either directly or indirectly through the rear-view mirrors and/or other reflecting surfaces of the vehicle.
- 4.3.5. *Geometric visibility*
Defined by angles α and β as specified in 1.9:
 α = 5° upwards and downwards,
 β = 45° outwards and 10° inwards.
- 4.3.6. *Alignment*
The alignment of the front fog lamps must not vary according to the angle of lock of the steering.
They must be directed forwards without causing undue dazzle or discomfort to oncoming drivers and other road users.
- 4.3.7. *May be 'grouped'*
with other front lamps.
- 4.3.8. *May not be 'combined'*
with other front lamps.
- 4.3.9. *May be 'reciprocally incorporated'*
- 4.3.9.1. with main-beam headlamps which do not swivel according to the angle of lock of the steering when there are four headlamps;
- 4.3.9.2. with the front position (side) lamps;
- 4.3.9.3. with the parking lamp.
- 4.3.10. *Electrical connections*
It must be possible to switch the fog lamps on and off independently of the main or dipped-beam headlamps and vice versa.

▼ M1

- 4.3.11. *Tell-tale*
Tell-tale optional.

▼ B

- 4.4. **Reversing lamps**

▼ M2

- 4.4.1. *Presence*
Mandatory on motor vehicles.

▼ M2

Optional on trailers.

▼ B

- 4.4.2. *Number*
One or two.
- 4.4.3. *Arrangement*
No individual specifications.
- 4.4.4. *Position*
- 4.4.4.1. *Width:*
No individual specifications.
- 4.4.4.2. *Height:*
Not less than 250 mm and not more than 1 200 mm above the ground.
- 4.4.4.3. *Length:*
At the back of the vehicle
- 4.4.5. *Geometric visibility*
Defined by angles α and β as specified in 1.9:
 α = 15° upwards and 5° downwards,
 β = 45° to right and left if there is only one lamp,
 β = 45° outwards and 30° inwards if there are two.
- 4.4.6. *Alignment*
Rearwards.
- 4.4.7. *May be 'grouped'*
with any other rear lamp.
- 4.4.8. *May not be 'combined'*
with other lamps.
- 4.4.9. *May not be 'reciprocally incorporated'*
with other lamps.
- 4.4.10. *Electrical connections*
It can only light up if the reverse gear is engaged and if the device which controls the starting or stopping of the engine is in such a position that operation of the engine is possible.
It must not light up or remain lit up if either of the above conditions is not satisfied.

▼ M1

- 4.4.11. *Tell-tale*
Tell-tale optional.

▼ B

- 4.5. **Direction indicator lamp**
- 4.5.1. *Presence* (see Appendix 4)
Mandatory. Types of direction indicator lamps fall into categories (1, 2 and 5) the assembly of which on one vehicle constitutes an arrangement ('A' and 'B').
Arrangement 'A' shall apply to all motor vehicles.
Arrangement 'B' shall apply to trailers only.
- 4.5.2. *Number*
The number of devices shall be such that they can emit signals which correspond to one of the arrangements referred to in 4.5.3.

▼ M1

- 4.5.3. *Arrangement*
A: Two front direction-indicator lamps (category 1).
Two rear direction-indicator lamps (category 2).

▼M1

Two side repeating direction-indicator lamps (category 5).

Where lamps combining the functions of front direction-indicator lamps (category 1) and side repeating direction-indicator lamps (category 5) are fitted, two additional side repeating direction-indicator lamps (category 5) may be fitted to meet the visibility requirements of 4.5.5.

B: Two rear direction-indicator lamps (category 2).

▼B

4.5.4. *Position*

▼M2

4.5.4.1. Width:

The edge of the illuminating surface furthest from the median longitudinal plane of the vehicle must not be more than 400 mm from the extreme outer edge of the vehicle.

The distance between the inner edges of the two illuminating surfaces shall not be less than 600 mm. Where the vertical distance between the rear direction indicator lamp and the corresponding rear position (side) lamp is not more than 300 mm, the distance between the extreme outer edge of the vehicle and the outer edge of the illuminating surface of the rear direction indicator lamp must not exceed, by more than 50 mm the distance between the extreme outer edge of the vehicle and the outer edge of the illuminating surface of the corresponding rear position (side) lamp.

▼B

4.5.4.2. Height:

Above the ground: not less than 500 mm for direction indicator lamps in category 5;
not less than 350 mm for direction indicator lamps in categories 1 and 2;
not more than 1 500 mm for all categories.

If the structure of the vehicle makes it impossible to keep to this maximum figure, the highest point on the illuminating surface may be at 2 300 mm in the case of direction indicator lamps in category 5 and at 2 100 mm in the case of direction indicator lamps in categories 1 and 2.

4.5.4.3. Length:

The distance between the centre of reference of the illuminating surface of the side indicator (arrangement 'A') and the transverse plane which marks the forward boundary of the vehicle's overall length, shall not exceed 1 800 mm. If the structure of the vehicle makes it impossible to comply with the minimum angles of visibility, this distance may be increased to 2 500 mm if the vehicle is equipped in conformity with arrangement 'A'.

▼M2

4.5.5. *Geometric visibility*

Horizontal angles: see Appendix 4.

Vertical angles: 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° if the lamps are less than 750 mm above the ground.

▼B

4.5.6. *Alignment*

If individual specifications for installation are laid down by the manufacturer they must be observed.

4.5.7. *May be 'grouped'*

with one or more lamps.

▼M1

4.5.8. *May not be 'combined'*

with another lamp. May be combined only with direction-indicator lamps of another category.

▼B

- 4.5.9. *May be 'reciprocally incorporated'*
with a parking lamp only.
- 4.5.10. *Electrical connections*
Direction indicator lamps shall switch on independently of the other lamps. All direction indicator lamps on one side of a vehicle shall be switched on and off by means of one control and must flash in phase.

▼M1

- 4.5.11. *Tell-tale*
Operational tell-tale mandatory for front and rear direction-indicator lamps. It may be optical or auditory or both. If it is optical, it shall be a flashing light which, at least in the event of the malfunction of any of the front or rear direction-indicator lamps, is either extinguished, or remains alight without flashing, or shows a marked change of frequency. If it is entirely auditory it shall be clearly audible and shall show a marked change of frequency, at least in the event of the malfunction of any of the front or rear direction-indicator lamps.

If a motor vehicle is equipped to draw a trailer, it must be fitted with a special optical operational tell-tale for the direction-indicator lamps on the trailer unless the tell-tale of the drawing vehicle allows the failure of any one of the direction-indicator lamps on the vehicle combination thus formed to be detected.

▼M2

- 4.5.12. *Other requirements*
The light shall be a flashing light, flashing 90 ± 30 times per minute.
Operation of the light signal control shall be followed within not more than one second by the emission of light and within not more than one and one half seconds by its first extinction. If a motor vehicle is equipped to draw a trailer, the control of the direction indicator lamps on the drawing vehicle shall also be capable of operating the indicator lamps on the trailer.
In the event of the failure of one direction indicator lamp, which is not due to a short circuit, the others must continue to flash but, under these conditions, the frequency may be different from that specified.
For front direction indicator lamps, the illuminating surface must be not less than 40 mm from the illuminating surface of the dipped-beam headlamps or front fog lamps if any. A smaller distance is permitted if the luminous intensity in the reference axis of the direction indicator lamp is not less than 400 cd.

▼B

- 4.6. **Hazard warning signal**
- 4.6.1. *Presence*
Mandatory.
- 4.6.2. *Number*
- 4.6.3. *Arrangement*
- 4.6.4. *Position*
- 4.6.4.1. *Width*
- 4.6.4.2. *Height*
- 4.6.4.3. *Length*
- 4.6.5. *Geometric visibility*
- 4.6.6. *Alignment*
- 4.6.7. *May/may not be 'grouped'*
- 4.6.8. *May/may not be 'combined'*
- 4.6.9. *May/may not be 'reciprocally incorporated'*
- } As specified in the corresponding headings of 4.5.

▼ M1

- 4.6.10. *Electrical connections*
The signal shall be operated by means of a separate control enabling all the direction-indicator lamps to flash in phase.
- 4.6.11. *Tell-tale*
Circuit-closed tell-tale mandatory. Flashing warning light, which can operate in conjunction with the tell-tale(s) specified in 4.5.11.

▼ B

- 4.6.12. *Other requirements*
As specified in 4.5.12. If a motor vehicle is equipped to draw a trailer the hazard warning signal control must be also capable of bringing the direction indicator lamps on the trailer into action. The hazard warning signal must be able to function even if the device which starts or stops the engine is in a position which makes it impossible to start the engine.
- 4.7. **Stop lamps**
- 4.7.1. *Presence*
Mandatory.
- 4.7.2. *Number*
Two.
- 4.7.3. *Arrangement*
No individual specifications.
- 4.7.4. *Position*
- 4.7.4.1. *Width:*
Not less than 600 mm apart. This distance may be reduced to 400 mm if the overall width of the vehicle is less than 1 300 mm.
- 4.7.4.2. *Height:*
Above the ground: not less than 350 mm, not more than 1 500 mm or not more than 2 100 mm if the shape of the body-work makes it impossible to keep within 1 500 mm.
- 4.7.4.3. *Length:*
At rear of vehicle.
- 4.7.5. *Geometric visibility*
Horizontal angle: 45° outwards and inwards.
Vertical angle: 15° above and below the horizontal.
The vertical angle below the horizontal may be reduced to 5° in the case of lamps less than 750 mm above the ground.
- 4.7.6. *Alignment*
Towards the rear of the vehicle.
- 4.7.7. *May be 'grouped'*
with one or more other rear lamps.

▼ M2

- 4.7.8. *Must not be 'combined'*
with another lamp, unless the rear position lamp is reciprocally incorporated with the stop lamp and combined with the rear registration plate lamp.

▼ B

- 4.7.9. *May be 'reciprocally incorporated'*
with the rear position (side) lamp or the parking lamp.

▼ M24.7.10. *Electrical connections*

Must light up when the service brake is applied. The stop lamps need not function if the device which starts and/or stops the engine is in a position which makes it impossible for the engine to operate.

▼ M14.7.11. *Tell-tale*

Tell-tale optional. Where fitted, this tell-tale must be an operational tell-tale consisting of a non-flashing warning light which comes on in the event of the malfunctioning of the stop lamps.

▼ M2**▼ B**4.8. **Rear registration plate lamp**4.8.1. *Presence*

Mandatory

4.8.2. *Number*4.8.3. *Arrangement*4.8.4. *Position*4.8.4.1. *Width*4.8.4.2. *Height*4.8.4.3. *Length*4.8.5. *Geometric visibility*4.8.6. *Alignment*4.8.7. *May be 'grouped'*

with one or more rear lamps.

4.8.8. *May be 'combined'*

with the rear position (side) lamps.

} Such that the device is capable of illuminating the space for the registration plate.

▼ M2

4.8.8.1. When the rear position lamps are reciprocally incorporated with the stop lamps, the photometric characteristics of the rear registration plate lamp may be modified during the illumination of the stop lamps.

▼ B4.8.9. *May not be 'reciprocally incorporated'*

with any other lamp.

▼ M24.8.10. *Electrical connections*

No individual specifications.

4.8.11. *Tell-tale*

Tell-tale optional. If it exists, its function must be carried out by the tell-tale required for the front and rear position (side) lamps.

▼ B4.9. **Front position (side) lamps**4.9.1. *Presence*

Mandatory on all motor vehicles.

Mandatory on trailers over 1 600 mm wide.

Optional on trailers which are not more than 1 600 mm wide.

4.9.2. *Number*

Two.

▼B

- 4.9.3. *Arrangement*
No individual specifications.
- 4.9.4. *Position*
- 4.9.4.1. *Width:*
The point on the illuminating surface which is farthest from the vehicle's median longitudinal plane must not be more than 400 mm from the extreme outer edge of the vehicle.

In the case of a trailer, the point on the illuminating surface which is farthest from the median longitudinal plane must be not more than 150 mm from the extreme outer edge of the vehicle.

The clearance between the respective inner edges of the two illuminating surfaces must not be less than 600 mm.
- 4.9.4.2. *Height:*
Above the ground: not less than 350 mm, not more than 1 500 mm or not more than 2 100 mm if the shape of the body-work makes it impossible to keep within 1 500 mm.
- 4.9.4.3. *Length:*
At front of vehicle.
- 4.9.5. *Geometric visibility*
Horizontal angle for the two front position (side) lamps:
either 45° inwards and 80° outwards,
or 80° inwards and 45° outwards.

Vertical angle:

15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of lamps less than 750 mm above the ground.
- 4.9.6. *Alignment*
Towards the front.
- 4.9.7. *May be 'grouped'*
with any other front lamp.
- 4.9.8. *May not be 'combined'*
with any other lamps.
- 4.9.9. *May be 'reciprocally incorporated'*
with any other front lamp.
- 4.9.10. *Electrical connections*
No individual specifications.

▼M2

- 4.9.11. *Tell-tale*
Circuit-closed tell-tale mandatory. This tell-tale shall be non-flashing and shall not be required if the instrument panel lighting can only be turned on simultaneously with the front position (side) lamps.

▼B

- 4.10. **Rear position (side) lamps**
- 4.10.1. *Presence*
Mandatory.
- 4.10.2. *Number*
Two.
- 4.10.3. *Arrangement*
No individual specifications.

▼B

- 4.10.4. *Position*
- 4.10.4.1. *Width:*
- The point on the illuminating surface which is farthest from the vehicle's median longitudinal plane must be not more than 400 mm from the extreme outer edge of the vehicle.
- The distance between the inner edges of the two illuminating surfaces shall be not less than 600 mm. This distance may be reduced to 400 mm where the overall width of the vehicle is less than 1 300 mm.
- 4.10.4.2. *Height:*
- Above the ground: not less than 350 mm, not more than 1 500 mm or not more than 2 100 mm if the shape of the body-work makes it impossible to keep within 1 500 mm.
- 4.10.4.3. *Length:*
- At rear of vehicle.
- 4.10.5. *Geometric visibility*
- Horizontal angle for the two rear position (side) lamps:
- either 45° inwards and 80° outwards,
or 80° inwards and 45° outwards.
- Vertical angle:
- 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of lamps less than 750 mm above the ground.
- 4.10.6. *Alignment*
- Towards the rear.
- 4.10.7. *May be 'grouped'*
- with any other rear lamp.
- 4.10.8. *May be 'combined'*
- with the rear registration plate lamp.
- 4.10.9. *May be 'reciprocally incorporated'*
- with the stop lamp or the rear fog lamp or the parking lamp.
- 4.10.10. *Electrical connections*
- No individual specifications.

▼M2

- 4.10.11. *Tell-tale*
- Circuit-closed tell-tale mandatory. It must be combined with that of the front position (side) lamps.

▼B

- 4.11. **Rear fog lamp**
- 4.11.1. *Presence*
- Mandatory.
- 4.11.2. *Number*
- One, a second being optional.
- 4.11.3. *Arrangement*
- No individual specifications.
- 4.11.4. *Position*

▼M2

- 4.11.4.1. *Width:*
- If there is only one rear fog lamp, it must be on the opposite side of the median longitudinal plane of the vehicle to the direction of traffic prescribed in the country of registration; the centre of reference may also be situated on the median longitudinal plane of the vehicle.

▼B

- 4.11.4.2. Height:
Between 250 and 1 000 mm above the ground.
- 4.11.4.3. Length:
At rear of vehicle.
- 4.11.5. *Geometric visibility*
Horizontal angle: 25° inwards and outwards.
Vertical angle: 5° above and below the horizontal.
- 4.11.6. *Alignment*
Towards the rear.
- 4.11.7. *May be 'grouped'*
with any other rear lamps.
- 4.11.8. *May not be 'combined'*
with other lamps.
- 4.11.9. *May be 'reciprocally incorporated'*
with the rear position (side) lamp or the parking lamp.

▼M2

- 4.11.10. *Electrical connections*
These must be such that the rear fog lamp can operate only when the dipped beam or main beam headlamps or the front fog lamps or a combination of these are switched on. They must be such that when the rear fog lamp is switched on it is capable of operating together with the main beam, the dipped beam and the front fog lamps.
When the rear fog lamp is switched on, operating the main-beam or dipped-beam control shall not extinguish the rear fog lamp.
If the front fog lamps exists, the extinguishing of the rear fog lamp must be possible independently from that of the front fog lamps.
- 4.11.11. *Tell-tale*
Circuit-closed tell-tale mandatory. An independant non-flashing warning light.
- 4.11.12. *Other requirements*
In all cases, the distance between the rear fog lamp and each stop lamp must be greater than 100 mm.

▼B

- 4.12. **Parking lamp**
- 4.12.1. *Presence*
on motor vehicles not exceeding 6 m in length and not exceeding 2 m in width: optional;
on all other vehicles: prohibited.
- 4.12.2. *Number*
Dependent upon the arrangement.
- 4.12.3. *Arrangement*
— either two front lamps and two rear lamps,
— or one lamp on each side.
- 4.12.4. *Position*
- 4.12.4.1. Width:
The point on the illuminating surface which is farthest from the median longitudinal plane of the vehicle must not be more than 400 mm from the extreme outer edge of the vehicle.
Furthermore, in the case of a pair of lamps, the lamps must be on the sides of the vehicle.
- 4.12.4.2. Height:

▼B

Above the ground: not less than 350 mm;
not more than 1 500 mm, or 2 100 mm if
the shape of the bodywork makes it
impossible to keep within 1 500 mm.

4.12.4.3. Length:

No individual specifications.

4.12.5. *Geometric visibility*

Horizontal angle: 45° outwards, towards the front and towards
the rear.

Vertical angle: 15° above and below the horizontal. The
vertical angle below the horizontal may be
reduced to 5° in the case of lamps less than
750 mm above the ground.

4.12.6. *Alignment*

Such that the lamps meet the specified conditions concerning
visibility towards the front and towards the rear.

4.12.7. *May be 'grouped'*

with any other lamp.

4.12.8. *May not be 'combined'*

with other lamps.

4.12.9. *May be 'reciprocally incorporated'*

— at the front: with the front position (side) lamp, the
dipped-beam headlamp, the main-beam head-
lamp and the fog lamp;

— at the rear: with the rear position (side) lamp, the stop
lamp and the fog lamp;

— with the category 5 direction indicator lamp.

▼M2

4.12.10. *Electrical connections*

The connection must allow the parking lamp(s) on the same side
of the vehicle to be lit independently of any other lamps.

The parking lamp(s) must be able to function even if the device
which starts and/or stops the engine is in a position which makes
it impossible for the engine to operate.

4.12.11. *Tell-tale*

Circuit-closed tell-tale optional. If there is one, it must not be
possible to confuse it with the tell-tale for the front and rear
position (side) lamps.

▼B

4.12.12. *Other requirements*

The function of this lamp may also be performed by simulta-
neously switching on the front and rear position (side) lamps on
the same side of the vehicle.

4.13. **End-outline marker lamp**

4.13.1. *Presence*

Mandatory on vehicles exceeding 2·10 m in width.

4.13.2. *Number*

Two visible from the front and two visible from the rear.

4.13.3. *Arrangement*

No individual specifications.

4.13.4. *Position*

4.13.4.1. Width:

As close as possible to the extreme outer edge of the vehicle.

▼B

- 4.13.4.2. Height:
At the maximum height compatible with the width requirements as to position and the symmetry of the lamps.
- 4.13.4.3. Length:
No individual specifications.
- 4.13.5. *Geometric visibility*
Horizontal angle: 80° outwards.
Vertical angle: 5° above and 20° below the horizontal.
- 4.13.6. *Alignment*
Such that the lamps meet the visibility requirements towards the front and towards the rear.

▼M2

- 4.13.7. *May be 'grouped'*
- 4.13.8. *May not be 'combined'*
- 4.13.9. *May not be 'reciprocally incorporated'*
- 4.13.10. *Electrical connections*
No individual specifications.

} with other lamps.

▼M2

- 4.13.11. *Tell-tale*
Tell-tale optional. If it exists, its function shall be carried out by the tell-tale required for the front and rear position (side) lamps.

▼B

- 4.13.12. *Other requirements*
Subject to all the other conditions being met, the lamp visible from the front and the lamp visible from the rear, on the same side of the vehicle, may be combined in one device.

The position of an end-outline marker lamp in relation to the corresponding position (side) lamp shall be such that the distance between the projections on a transverse vertical plane of the points nearest to the illuminating surfaces of the two lamps considered is not less than 200 mm.
- 4.14. **Rear reflex reflector, non-triangular**
- 4.14.1. *Presence*
Mandatory on motor vehicles.
Prohibited on trailers.
- 4.14.2. *Number*
Two.
- 4.14.3. *Arrangement*
No individual specifications.
- 4.14.4. *Position*
- 4.14.4.1. Width:
The point on the illuminating surface which is farthest from the vehicle's median longitudinal plane must be not more than 400 mm from the extreme outer edge of the vehicle.

The distance between the inner edges of the reflex reflectors shall not be less than 600 mm. This distance may be reduced to 400 mm if the overall width of the vehicle is less than 1 300 mm.
- 4.14.4.2. Height:
Above the ground: not less than 350 mm and not more than 900 mm.

▼ M2

- 4.14.4.3. Length:
At rear of vehicle.

▼ B

- 4.14.5. *Geometric visibility*
Horizontal angle: 30° inwards and outwards.
Vertical angle: 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of a reflex reflector less than 750 mm above the ground.
- 4.14.6. *Alignment*
To the rear.
- 4.14.7. *May be 'grouped'*
with any other lamp.
- 4.14.8. *Other requirements*
The illuminating surface of the reflex reflector may have parts in common with the illuminating surface of any other rear lamp.

4.15. **Rear reflex reflector, triangular**

- 4.15.1. *Presence*
Mandatory on trailers.
Prohibited on motor vehicles.
- 4.15.2. *Number*
Two.
- 4.15.3. *Arrangement*
The apex of the triangle must be uppermost.
- 4.15.4. *Position*
- 4.15.4.1. Width:
The point of the illuminating surface which is furthest from the vehicle's median longitudinal plane must not be further than 400 mm from the extreme outer edge of the vehicle.
The distance between the inner edges of the reflex reflectors shall not be less than 600 mm. This distance may be reduced to 400 mm if the overall width of the vehicle is less than 1 300 mm.
- 4.15.4.2. Height:
Above the ground: not less than 350 mm and not more than 900 mm.

▼ M2

- 4.15.4.3. Length:
At rear of vehicle.

▼ B

- 4.15.5. *Geometric visibility*
Horizontal angle: 30° inwards and outwards.
Vertical angle: 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of a reflex reflector less than 750 mm above the ground.
- 4.15.6. *Alignment*
To the rear.
- 4.15.7. *May not be 'grouped'*
with any other lamp.
- 4.15.8. *Other requirements*
No lamp may be placed within the triangle.

▼B4.16. **Front reflex reflector, non-triangular**4.16.1. *Presence*

Mandatory on trailers.

4.16.2. *Number*

Two.

4.16.3. *Arrangement*

No individual specifications.

4.16.4. *Position*

4.16.4.1. Width:

The point of the illuminating surface which is furthest from the vehicle's median longitudinal plane must not be further than 400 mm from the extreme outer edge of the vehicle.

In the case of a trailer, the point of the illuminating surface which is furthest from the vehicle's median longitudinal plane must not be further than 150 mm from the extreme outer edge of the vehicle.

The distance between the inner edges of the reflex reflectors shall not be less than 600 mm. This distance may be reduced to 400 mm if the overall width of the vehicle is less than 1 300 mm.

4.16.4.2. Height:

Above the ground: not less than 350 mm and not more than 900 mm, or 1 500 mm if the structure of the vehicle makes it impossible to keep within 900 mm.

▼M2

4.16.4.3. Length:

At front of vehicle.

4.16.5. *Geometric visibility*

Horizontal angle: 30° inwards and outwards.

If, on account of adjustable drawbars, it is not possible to satisfy the inward angle requirement of 30°, it may be reduced to 10°.

Vertical angle: 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of a reflex reflector, less than 750 mm above the ground.

▼B4.16.6. *Alignment*

Towards the front.

4.16.7. *May be 'grouped'*

with the front position (side) lamp.

4.16.8. *Other requirements*

The illuminating surface of the reflex reflector may have parts in common with that of the front position (side) lamp.

4.17. **Side reflex reflector, non-triangular**4.17.1. *Presence*

Mandatory:

- on all motor vehicles the length of which exceeds 6 m, except those in category M₁,
- on all trailers.

Optional:

- on motor vehicles in category M₁,
- on motor vehicles, other than those in category M₁, the length of which does not exceed 6 m.

4.17.2. *Minimum number per side*

Such that the rules for longitudinal positioning are complied with.

▼B

- 4.17.3. *Arrangement*
No individual specifications.
- 4.17.4. *Position*
- 4.17.4.1. Width:
No individual specifications.
- 4.17.4.2. Height:
Above the ground: not less than 350 mm and not more than 900 mm. If the structure of the vehicle does not allow of compliance with the maximum height, this limit may be raised to 1 500 mm.

▼M2

- 4.17.4.3. Length:
At least one reflex reflector must be fitted to the middle third of the vehicle, the foremost reflex reflector being not further than 3 m from the front, in the case of trailers, account shall be taken of the length of the drawbar for the measurement of this distance.
The distance between two adjacent reflex reflectors shall not exceed 3 m.
The distance between the rearmost reflex reflector and the rear of the vehicle shall not exceed 1 m.
However, for M₁ category vehicles, it is sufficient to have one reflex reflector fitted within the first third and one within the last third of the vehicle length.

▼B

- 4.17.5. *Geometric visibility*
Horizontal angle: 45° to the front and to the rear.
Vertical angle: 15° above and below the horizontal. The vertical angle below the horizontal may be reduced to 5° in the case of a reflex reflector less than 750 mm above the ground.
- 4.17.6. *Alignment*
The reference axis of the reflex reflector must be horizontal and perpendicular to the vehicle's median longitudinal plane and directed outwards.
- 4.17.7. *May be 'grouped'*
with other lamps.
5. CONFORMITY OF PRODUCTION
- 5.1. Every series-produced vehicle must conform to the vehicle type which received type-approval as regards the installation of lighting and light-signalling devices and their characteristics as specified by this Directive.

Appendix 1

Loading conditions on axles referred to in 4.2.6.1

1. For the following tests, the mass of the passengers shall be calculated on the basis of 75 kg per person.
2. Loading conditions for different types of vehicles:
 - 2.1. Vehicles in category M₁.
 - 2.1.1. The angle of the light beam of the dipped-beam headlamps shall be determined under the following load conditions:
 - 2.1.1.1. one person in the driver's seat;
 - 2.1.1.2. the driver, plus one passenger in the front seat farthest from the driver;
 - 2.1.1.3. the driver, one passenger in the front seat farthest from the driver, all the seats farthest to the rear occupied;
 - 2.1.1.4. all the seats occupied;
 - 2.1.1.5. all the seats occupied, plus an evenly distributed load in the luggage boot, in order to obtain the permissible load on the rear axle or on the front axle if the boot is at the front. If the vehicle has a front and a rear boot, the additional load must be appropriately distributed in order to obtain the permissible axle loads. However, if the maximum permissible laden weight is obtained before the permissible load on one of the axles, the loading of the boot(s) shall be limited to the figure which enables that weight to be reached;
 - 2.1.1.6. driver, plus an evenly distributed load in the boot, in order to obtain the permissible load on the corresponding axle.

However, if the maximum permissible laden weight is obtained before the permissible load on the axle, the loading of the boot(s) shall be limited to the figure which enables that weight to be reached.
 - 2.1.2. In determining the above loading conditions, account must be taken of any loading restrictions laid down by the manufacturer.
 - 2.2. Vehicles in categories M₂ and M₃.

The angle of the light beam from the dipped-beam headlamps must be determined under the following loading conditions:

 - 2.2.1. vehicle unladen;
 - 2.2.2. vehicle laden in such a way that each of the axles carries its technically permissible load.
 - 2.3. Vehicles in category N with load surfaces.
 - 2.3.1. The angle of the light beam from the dipped-beam headlamps must be determined under the following loading conditions:
 - 2.3.1.1. vehicle unladen;
 - 2.3.1.2. one person in the driver's seat, the load being distributed in order to obtain the maximum technically permissible load on the rear axle and the unladen weight on the front axle. The procedure is the same if the load surface is situated at the front.
 - 2.4. Vehicles in category N without load surface.
 - 2.4.1. Drawing vehicles for semi-trailers:
 - 2.4.1.1. unladen vehicle without a load on the coupling attachment;
 - 2.4.1.2. one person in the driver's seat; technically permissible load on the coupling attachment in the position of the attachment corresponding to the highest load on the rear axle.
 - 2.4.2. Drawing vehicles for trailers:
 - 2.4.2.1. vehicle unladen;
 - 2.4.2.2. one person in the driver's seat, all the other places in the driving cabin being occupied.

 $d \leq 1.80 \text{ m}$.

Arrangement B

▼ **M2***Appendix 5***Measurement of the variation of dipped beam inclination as a function of load**

1. SCOPE

This Appendix specifies a method for measuring variations in motor vehicle dipped beam inclination, in relation to its initial inclination, caused by changes in vehicle attitude due to loading.

2. DEFINITIONS

2.1. **Initial inclination**2.1.1. *Stated initial inclination:*

the value of the dipped beam initial inclination specified by the motor vehicle manufacturer serving as a reference value for the calculation of permissible variations.

2.1.2. *Measured initial inclination:*

the mean value of dipped beam inclination or vehicle inclination measured with the vehicle in condition No 1, as defined in Appendix 1, for the category of vehicle under test. It serves as a reference value for the assessment of variations in beam inclination as the load varies.

2.2. Dipped-beam inclination may be defined:

- either as the angle, expressed in milliradians, between the direction of the beam towards a characteristic point on the horizontal part of the cut-off in the luminous distribution of the headlamp and the horizontal plane,
- or by the tangent of that angle, expressed in percentage inclination, since the angles are small (for these small angles, 1 % is equal to 10 mrad).

If the inclination is expressed in percentage inclination, it can be calculated by means of the following formula:

$$\frac{h_1 - h_2}{l} \times 100$$

where:

h_1 is the height above the ground, in millimetres, of the abovementioned characteristic point, measured on a vertical screen perpendicular to the vehicle longitudinal median plane, placed at a horizontal distance 1;

h_2 is the height above the ground, in millimetres, of the centre of reference (which is taken to be the nominal origin of the characteristic point chosen in h_1);

1 is the distance, in millimetres, from the screen to the centre of reference.

Negative values denote downward inclination (see Figure 1).

Positive values denote upward inclination.

Figure 1

Dipped beam downward inclination of a category M₁ vehicle

▼ **M2***Notes:*

1. This drawing represents a category M₁ vehicle, but the principle shown applies equally to vehicles of other categories.
2. Where the vehicle does not incorporate a headlamp levelling system, the variation in dipped beam inclination is identical with the variation in the inclination of the vehicle itself.

3. MEASUREMENT CONDITIONS

- 3.1. If a visual inspection of the dipped beam pattern on the screen or a photometric method is used, measurement shall be carried out in a dark environment (for example, a dark room) of sufficient area to allow the vehicle and the screen to be placed as shown in Figure 1. Headlamp centres of reference shall be at a distance *l* from the screen of at least 10 m.
- 3.2. The ground on which measurements are made shall be as flat and horizontal as possible, so that the reproducibility of measurements of dipped beam inclination can be assured with an accuracy of ± 0.5 mrad (± 0.05 % inclination).
- 3.3. If a screen is used, its marking, position and orientation in relation to the ground and to the median longitudinal plane of the vehicle, shall be such that the reproducibility of the measurement of the dipped beam inclination can be assured with an accuracy of ± 0.5 mrad (± 0.05 % inclination).
- 3.4. During measurements, the ambient temperature shall be between 10 and 30 °C.

4. VEHICLE PREPARATION

- 4.1. Measurements shall be carried out on a vehicle which has travelled a distance of between 1 000 and 10 000 km, preferably 5 000 km.
- 4.2. Tyres shall be inflated to the full-load pressure specified by the vehicle manufacturer. The vehicle shall be fully replenished (fuel, water, oil) and equipped with all the accessories and tools specified by the manufacturer. Full fuel replenishment means that the fuel tank must be filled to not less than 90 % of its capacity as indicated in the information document, a model of which appears in Annex I to Directive 70/156/EEC.
- 4.3. The vehicle shall have the parking brake released and the gearbox in neutral.
- 4.4. The vehicle shall be conditioned for at least 8 h at the temperature specified in Item 3.4.
- 4.5. If a photometric or visual method is used, headlamps with a well-defined dipped beam cut-off should preferably be installed on the vehicle under test in order to facilitate the measurements.

Other methods may be employed to obtain a more precise reading (for example, removal of the headlamp lens).

5. TEST PROCEDURE

5.1. **General**

The variations in either dipped beam or vehicle inclination, depending on the method chosen, shall be measured separately for each side of the vehicle. The results obtained from both left and right headlamps under all the load conditions specified in Appendix 1, shall be within the limits set out in Item 5.5. The load shall be applied gradually without subjecting the vehicle to excessive shocks.

5.2. **Determination of the measured initial inclination**

The vehicle shall be prepared as specified in Item 4 and laden as specified in Appendix 1 (first loading condition of the respective vehicle category).

Before each measurement, the vehicle shall be rocked as specified in Item 5.4.

Measurements shall be made three times.

▼ **M2**

- 5.2.1. If none of the three measured results differs by more than 2 mrad (0.2 % inclination) from the arithmetic mean of the results, that mean shall constitute the final result.
- 5.2.2. If any measurement differs from the arithmetic mean of the results by more than 2 mrad (0.2 % inclination), a further series of 10 measurements shall be made, the arithmetic mean of which shall constitute the final result.
- 5.3. **Measurement methods**
- Any method may be used to measure variations of inclination provided that the readings are accurate to within ± 0.2 mrad (± 0.02 % inclination).
- 5.4. **Treatment of vehicle in each loading condition**
- The vehicle suspension and any other part likely to affect dipped beam inclination shall be activated according to the methods described below.
- However, the technical authorities and manufacturers may jointly propose other methods (either experimental or based upon calculations), especially when the test poses particular problems, provided such calculations are clearly valid.
- 5.4.1. *M₁ category vehicles with conventional suspension*
- With the vehicle standing on the measuring site and, if necessary, with the wheels resting on floating platforms (which must be used if their absence would lead to restriction of the suspension movement likely to affect the results of measurements), rock the vehicle continuously for at least three complete cycles; for each cycle, first the rear and then the front end of the vehicle is pushed down.
- The rocking sequence shall end with the completion of a cycle. Before making the measurements, the vehicle shall be allowed to come to rest spontaneously. Instead of using floating platforms, the same effect can be achieved by moving the vehicle backwards and forwards for at least a complete wheel revolution.
- 5.4.2. *M₂, M₃ and N category vehicles with conventional suspension*
- 5.4.2.1. If the treatment method for category M₁ vehicles described in Item 5.4.1 is not possible, the method described in Item 5.4.2.2 or 5.4.2.3 may be used.
- 5.4.2.2. With the vehicle standing on the measuring site and the wheels on the ground, rock the body by temporarily varying the load.
- 5.4.2.3. With the vehicle standing on the measuring site and the wheels on the ground, activate the vehicle suspension and all other parts which may affect the dipped beam inclination by using a vibration rig. This can be a vibrating platform on which the wheels rest.
- 5.4.3. *Vehicles with non-conventional suspension, where the engine has to be running*
- Before making any measurement wait until the vehicle has assumed its final attitude with the engine running.
- 5.5. **Measurements**
- The variation of the inclination of the dipped beam shall be assessed for each of the different loading conditions in relation to the measured initial inclination determined in accordance with Item 5.2.
- If the vehicle is fitted with a manual headlamp-levelling system, the latter shall be adjusted to the positions specified by the manufacturer for given loading conditions (according to Appendix 1).
- 5.5.1. To begin with, a single measurement shall be made in each loading condition. Requirements have been met if, for all the loading conditions, the variation in inclination is within the calculated limits (for example, within the difference between the stated initial inclination and the lower and upper limits specified for approval) with a tolerance of 4 mrad (0.4 % inclination).
- 5.5.2. If the result(s) of any measurement(s) does (do) not lie within the tolerance indicated in Item 5.5.1 or exceed(s) the limit values, a further three measurements shall be made in the loading conditions corresponding to this (these) result(s) as specified in Item 5.5.3.

▼ M2

- 5.5.3. For each of the above loading conditions:
- 5.5.3.1. If none of the three measured results differs by more than 2 mrad (0.2 % inclination) from the arithmetic mean of the results, that mean shall constitute the final result.
 - 5.5.3.2. If any measurement differs from the arithmetic mean of the results by more than 2 mrad (0.2 % inclination), a further series of ten measurements shall be made, the arithmetic mean of which shall constitute the final result.
 - 5.5.3.3. If a vehicle is fitted with an automatic headlamp-levelling system which has an inherent hysteresis loop, average results at the top and bottom of the hysteresis loop shall be taken as significant values.
All these measurements shall be made in accordance with Items 5.5.3.1 and 5.5.3.2.
- 5.5.4. Requirements have been met, if, under all loading conditions, the variation between the measured initial inclination determined in accordance with Item 5.2 and the inclination measured under each loading condition is less than the values calculated in Item 5.5.1 (without safety margin).
- 5.5.5. If only one of the calculated upper or lower limits of variation is exceeded, the manufacturer shall be permitted to choose a different value for the stated initial inclination, within the limits specified for approval.

▼ M2

Appendix 6

Indication of the stated initial adjustment referred to in Item 4.2.6.1 of Annex I

Example

The size of the symbol and characters is left to the discretion of the manufacturer.

▼ **M2***Appendix 7***The controls for the headlamp-levelling devices referred to in Items 4.2.6.2.2 of Annex I**

1. SPECIFICATIONS

1.1. Downward inclination of the dipped beam must in all cases be produced in one of the following ways:

- (a) by moving a control downwards or to the left;
- (b) by rotating a control in a counterclockwise direction;
- (c) by depressing a button (push-pull control).

If several buttons are used to adjust the beam, the button which gives the greatest downward inclination must be installed to the left or below the button(s) for other dipped beam positions.

A rotary control which is installed edge-on, or with only the edge visible, should follow the operating principles of controls of types (a) or (c).

- 1.1.1. This control must carry symbols indicating clearly the movements corresponding to the downward and upward inclination of the dipped beam.
- 1.2. The '0' position corresponds to the initial alignment according to Item 4.2.6.1 of Annex I.
- 1.3. The '0' position which, according to Item 4.2.6.2.2 of Annex I, has to be a 'stop position', need not necessarily be at the end of the scale.
- 1.4. The marks used on the control must be explained in the owner's hand-book.
- 1.5. Only the following symbols may be used to identify the controls:

Standard symbol for dipped beam headlamp according to Figure 3 of Annex II to Directive 78/316/EEC, showing the arrows which correspond to the direction of the dipped beam adjustment.
