

Commission Regulation (EU) No 601/2012 of 21 June 2012 on the monitoring and reporting of greenhouse gas emissions pursuant to Directive 2003/87/EC of the European Parliament and of the Council (Text with EEA relevance) (repealed)

## ANNEX I

**Minimum content of the monitoring plan (Article 12(1))****1. Minimum content of the monitoring plan for installations**

The monitoring plan for an installation shall contain at least the following information:

- (1) general information on the installation:
  - (a) a description of the installation and activities carried out by the installation to be monitored, containing a list of emissions sources and source streams to be monitored for each activity carried out within the installation and meeting the following criteria:
    - (i) the description must be sufficient for demonstrating that neither data gaps nor double counting of emissions occur;
    - (ii) a simple diagram of the emission sources, source streams, sampling points and metering equipment must be added where requested by the competent authority or where such diagram simplifies describing the installation or referencing emission sources, source streams, measuring instruments and any other parts of the installation relevant for the monitoring methodology including data flow activities and control activities;
  - (b) a description of the procedure for managing the assignment of responsibilities for monitoring and reporting within the installation, and for managing the competences of responsible personnel;
  - (c) a description of the procedure for regular evaluation of the monitoring plan's appropriateness, covering at least the following:
    - (i) checking the list of emissions sources and source streams, ensuring completeness of the emission sources and source streams and that all relevant changes in the nature and functioning of the installation will be included in the monitoring plan;
    - (ii) assessing compliance with the uncertainty thresholds for activity data and other parameters, where applicable, for the applied tiers for each source stream and emission source;
    - (iii) assessing potential measures for improvement of the monitoring methodology applied;
  - (d) a description of the written procedures of the data flow activities pursuant to Article 57, including a diagram where appropriate for clarification;
  - (e) a description of the written procedures for the control activities established pursuant to Article 58;
  - (f) where applicable, information on relevant links with activities undertaken in the framework of the Community eco-management and audit scheme (EMAS) established pursuant to Regulation (EC) No 1221/2009 of the European Parliament and of the Council<sup>(1)</sup>, systems covered by harmonised standard ISO 14001:2004 and other environmental management systems

- including information on procedures and controls with relevance to greenhouse gas emissions monitoring and reporting;
- (g) the version number of the monitoring plan;
- (2) a detailed description of the calculation-based methodologies where applied, consisting of the following:
- (a) a detailed description of the calculation-based methodology applied, including a list of input data and calculation formulae used, a list of the tiers applied for activity data and all relevant calculation factors for each of the source streams to be monitored;
- (b) where applicable and where the operator intends to make use of simplification for minor and *de-minimis* source streams, a categorisation of the source streams into major, minor and *de-minimis* source streams;
- (c) a description of the measurement systems used, and their measurement range, specified uncertainty and exact location of the measuring instruments to be used for each of the source streams to be monitored;
- (d) where applicable, the default values used for calculation factors indicating the source of the factor, or the relevant source, from which the default factor will be retrieved periodically, for each of the source streams;
- (e) where applicable, a list of the analysis methods to be used for the determination of all relevant calculation factors for each of the source streams, and a description of the written procedures for those analyses;
- (f) where applicable, a description of the procedure underpinning the sampling plan for the sampling of fuel and materials to be analysed, and the procedure used to revise the appropriateness of the sampling plan;
- (g) where applicable, a list of laboratories engaged in carrying out relevant analytical procedures and, where the laboratory is not accredited as referred to in Article 34(1) a description of the procedure used for demonstrating the compliance with equivalent requirements in accordance with Article 34(2) and (3);
- (3) where a fall-back monitoring methodology is applied in accordance with Article 22, a detailed description of the monitoring methodology applied for all source streams or emission sources, for which no tier methodology is used, and a description of the written procedure used for the associated uncertainty analysis to be carried out;
- (4) a detailed description of the measurement-based methodologies, where applied, including the following:
- (a) a description of the measurement method including descriptions of all written procedures relevant for the measurement and the following:
- (i) any calculation formulae used for data aggregation and used to determine the annual emissions of each emission source;
- (ii) the method for determining whether valid hours or shorter reference periods for each parameter can be calculated, and for substitution of missing data in accordance with Article 45;

- (b) a list of all relevant emission points during typical operation, and during restrictive and transition phases, including breakdown periods or commissioning phases, supplemented by a process diagram where requested by the competent authority;
  - (c) where flue gas flow is derived by calculation, a description of the written procedure for that calculation for each emission source monitored using a measurement-based methodology;
  - (d) a list of all relevant equipment, indicating its measurement frequency, operating range and uncertainty;
  - (e) a list of applied standards and of any deviations from those standards;
  - (f) a description of the written procedure for carrying out the corroborating calculations in accordance with Article 46, where applicable;
  - (g) a description of the method, how CO<sub>2</sub> stemming from biomass is to be determined and subtracted from the measured CO<sub>2</sub> emissions, and of the written procedure used for that purpose, where applicable;
- (5) in addition to elements listed in point 4, a detailed description of the monitoring methodology where N<sub>2</sub>O emissions are monitored, where appropriate in the form of description of the written procedures applied, including a description of the following:
- (a) the method and parameters used to determine the quantity of materials used in the production process and the maximum quantity of material used at full capacity;
  - (b) the method and parameters used to determine the quantity of product produced as an hourly output, expressed as nitric acid (100 %), adipic acid (100 %), caprolactam, glyoxal and glyoxylic acid per hour respectively;
  - (c) the method and parameters used to determine the N<sub>2</sub>O concentration in the flue gas from each emission source, its operating range, and its uncertainty, and details of any alternative methods to be applied where concentrations fall outside the operating range and the situations when this may occur;
  - (d) the calculation method used to determine N<sub>2</sub>O emissions from periodic, unabated sources in nitric acid, adipic acid, caprolactam, glyoxal and glyoxylic acid production;
  - (e) the way in which or the extent to which the installation operates with variable loads, and the manner in which the operational management is carried out;
  - (f) the method and any calculation formulae used to determine the annual N<sub>2</sub>O emissions and the corresponding CO<sub>2(e)</sub> values of each emission source;
  - (g) information on process conditions that deviate from normal operations, an indication of the potential frequency and the duration of such conditions, as well as an indication of the volume of the N<sub>2</sub>O emissions during the deviating process conditions such as abatement equipment malfunction;
- (6) a detailed description of the monitoring methodology as far as perfluorocarbons from primary aluminium production are monitored, where appropriate in the form of a description of the written procedures applied, including the following:

- (a) where applicable, the dates of measurement for the determination of the installation-specific emission factors  $SEF_{CF_4}$  or OVC, and  $F_{C_2F_6}$ , and a schedule for future repetitions of that determination;
  - (b) where applicable, the protocol describing the procedure used to determine the installation-specific emission factors for  $CF_4$  and  $C_2F_6$ , showing also that the measurements have been and will be carried out for a sufficiently long time for measured values to converge, but at least for 72 hours;
  - (c) where applicable, the methodology for determining the collection efficiency for fugitive emissions at installations for primary aluminium production;
  - (d) a description of cell type and type of anode;
- (7) a detailed description of the monitoring methodology where transfer of inherent  $CO_2$  as part of a fuel in accordance with Article 48 or transfer of  $CO_2$  in accordance with Article 49 are carried out, where appropriate in the form of a description of the written procedures applied, including the following:
- (a) where applicable, the location of equipment for temperature and pressure measurement in a transport network;
  - (b) where applicable, procedures for preventing, detecting and quantification of leakage events from transport networks;
  - (c) in the case of transport networks, procedures effectively ensuring that  $CO_2$  is transferred only to installations which have a valid greenhouse gas emission permit, or where any emitted  $CO_2$  is effectively monitored and accounted for in accordance with Article 49;
  - (d) identification of the receiving and transferring installations according to the installation identification code recognised in accordance with Regulation (EU) No 1193/2011;
  - (e) where applicable, a description of continuous measurement systems used at the points of transfer of  $CO_2$  between installations transferring  $CO_2$  in accordance with Articles 48 or 49;
  - (f) where applicable, a description of the conservative estimation method used for determining the biomass fraction of transferred  $CO_2$  in accordance with Article 48 or 49;
  - (g) where applicable, quantification methodologies for emissions or  $CO_2$  released to the water column from potential leakages as well as the applied and possibly adapted quantification methodologies for actual emissions or  $CO_2$  released to the water column from leakages, as specified in section 23 of Annex IV.

## 2. **Minimum content of monitoring plans for aviation emissions**

1. The monitoring plan shall contain the following information for all aircraft operators:
  - (a) the identification of the aircraft operator, call sign or other unique designator used for air traffic control purposes, contact details of the aircraft operator and of a responsible person at the aircraft operator, contact address, the administering Member State, the administering competent authority;

- (b) an initial list of aircraft types in its fleet operated at the time of the submission of the monitoring plan and the number of aircraft per type, and an indicative list of additional aircraft types expected to be used including, where available, an estimated number of aircraft per type as well as the source streams (fuel types) associated with each aircraft type;
  - (c) a description of procedures, systems and responsibilities used to update the completeness of the list of emission sources over the monitoring year for the purpose of ensuring the completeness of monitoring and reporting of the emissions of owned aircraft as well as leased-in aircraft;
  - (d) a description of the procedures used to monitor the completeness of the list of flights operated under the unique designator by aerodrome pair, and the procedures used for determining whether flights are covered by Annex I to Directive 2003/87/EC for the purpose of ensuring completeness of flights and avoiding double-counting;
  - (e) a description of the procedure for managing and assigning responsibilities for monitoring and reporting, and for managing the competences of responsible personnel;
  - (f) a description of the procedure for regular evaluation of the monitoring plan's appropriateness, including any potential measures for the improvement of the monitoring methodology and related procedures applied;
  - (g) a description of the written procedures of the data flow activities as required by Article 57, including a diagram, where appropriate, for clarification;
  - (h) a description of the written procedures for the control activities established under Article 58;
  - (i) where applicable, information on relevant links with activities undertaken in the framework of EMAS, systems covered by harmonised standard ISO 14001:2004 and other environmental management systems, including information on procedures and controls with relevance to greenhouse gas emissions monitoring and reporting;
  - (j) the version number of the monitoring plan.
2. The monitoring plan shall contain the following information for aircraft operators which are not small emitters in accordance with Article 54(1) or which do not intend to use a small emitter tool in accordance with Article 54(2):
- (a) a description of the written procedure to be used for defining the monitoring methodology for additional aircraft types which an aircraft operator expects to use;
  - (b) a description of the written procedures for monitoring fuel consumption in every aircraft, including:
    - (i) the chosen methodology (Method A or Method B) for calculating the fuel consumption; and where the same method is not applied for all aircraft types, a justification for that methodology, as well as a list specifying which method is used under which conditions;
    - (ii) procedures for the measurement of fuel uplifts and fuel in tanks, including the selected tiers, a description of the measuring instruments involved and the procedures for recording, retrieving, transmitting and storing information regarding measurements, as applicable;

- (iii) the chosen method for the determination of density, where applicable;
  - (iv) a procedure to ensure that the total uncertainty of fuel measurements is consistent with the requirements of the required tier, where possible referring to national laws, clauses in customer contracts or fuel supplier accuracy standards;
- (c) a list of deviations for specific aerodromes from the general monitoring methodology as described in point (b) where it is not possible for the aircraft operator due to special circumstances to provide all the required data for the required monitoring methodology;
- (d) where relevant, the procedures for the measurement of the density used for fuel uplifts and fuel in tanks, including a description of the measuring instruments involved, or where measurement is not feasible, the standard value used and a justification for that methodology;
- (e) emission factors used for each fuel type, or in the case of alternative fuels, the methodologies for determining the emission factors, including the methodology for sampling, methods of analysis, a description of the laboratories used and of their accreditation and/or of their quality assurance procedures;
- (f) a description of the method to be used to determine surrogate data for closing data gaps pursuant to Article 65(2).

### 3. **Minimum content of monitoring plans for tonne-kilometre data**

The monitoring plan for tonne-kilometre data shall contain the following information:

- (a) the elements listed in point 1 of section 2 of this Annex;
- (b) a description of the written procedures used for determining tonne-kilometre data per flight, including:
  - (i) the procedures, responsibilities, data sources and calculation formulae for determining and recording the distance per aerodrome pair;
  - (ii) the tier used for determining the mass of passengers including the checked in baggage; in the case of tier 2, a description of the procedure for obtaining the mass of passengers and baggage is to be provided;
  - (iii) a description of the procedures used to determine the mass of freight and mail, where applicable;
  - (iv) a description of the measurement devices used for measuring the mass of passengers, freight and mail as applicable.

## ANNEX II

### **Tier thresholds for calculation-based methodologies related to installations (Article 12(1))**

#### 1. **Definition of tiers for activity data**

*Status: This is the original version (as it was originally adopted).*

The uncertainty thresholds in Table 1 shall apply to tiers relevant to activity data requirements in accordance with point (a) of Article 28(1) and the first subparagraph of Article 29(2), and Annex IV, of this Regulation. The uncertainty thresholds shall be interpreted as maximum permissible uncertainties for the determination of source streams over a reporting period.

Where Table 1 does not include activities listed in Annex I to Directive 2003/87/EC and the mass balance is not applied, the operator shall use the tiers listed in Table 1 under 'Combustion of fuels and fuels used as process input' for those activities.

TABLE 1

**Tiers for activity data (maximum permissible uncertainty for each tier)**

Activity/ source stream type	Parameter to which the uncertainty is applied	Tier 1	Tier 2	Tier 3	Tier 4
<b>Combustion of fuels and fuels used as process input</b>					
Commercial standard fuels	Amount of fuel [t] or [Nm <sup>3</sup> ]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Other gaseous and liquid fuels	Amount of fuel [t] or [Nm <sup>3</sup> ]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Solid fuels	Amount of fuel [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Flaring	Amount of flare gas [Nm <sup>3</sup> ]	± 17,5 %	± 12,5 %	± 7,5 %	
Scrubbing: carbonate (Method A)	Amount carbonate consumed [t]	± 7,5 %			
Scrubbing: gypsum (Method B)	Amount gypsum produced [t]	± 7,5 %			
<b>Refining of mineral oil</b>					
Catalytic cracker regeneration <sup>a</sup>	Uncertainty requirements apply separately for each emission source	± 10 %	± 7,5 %	± 5 %	± 2,5 %
Hydrogen production	Hydrocarbon feed [t]	± 7,5 %	± 2,5 %		

**a** For monitoring emissions from catalytic cracker regeneration (other catalyst regeneration and flexi-cokers) in mineral oil refineries, the required uncertainty is related to the total uncertainty of all emissions from that source.

**b** Amount [t] of CKD or bypass dust (where relevant) leaving the kiln system over a reporting period estimated using industry best practice guidelines.

*Status: This is the original version (as it was originally adopted).*

Production of coke					
Mass balance methodology	Each input and output material [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Metal ore roasting and sintering					
Carbonate input	Carbonate input material and process residues [t]	± 5 %	± 2,5 %		
Mass balance methodology	Each input and output material [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Production of iron and steel					
Fuel as process input	Each mass flow into and from the installation [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Mass balance methodology	Each input and output material [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Production of cement clinker					
Kiln input based (Method A)	Each relevant kiln input [t]	± 7,5 %	± 5 %	± 2,5 %	
Clinker output (Method B)	Clinker produced [t]	± 5 %	± 2,5 %		
CKD	CKD or bypass dust [t]	n.a. <sup>b</sup>	± 7,5 %		
Non-carbonate carbon	Each raw material [t]	± 15 %	± 7,5 %		
Production of lime and calcination of dolomite and magnesite					
Carbonates (Method A)	Each relevant kiln input [t]	± 7,5 %	± 5 %	± 2,5 %	
Alkali earth oxide (Method B)	Lime produced [t]	± 5 %	± 2,5 %		
Kiln dust (Method B)	Kiln dust [t]	n.a. <sup>b</sup>	± 7,5 %		
<b>a</b>	For monitoring emissions from catalytic cracker regeneration (other catalyst regeneration and flexi-cokers) in mineral oil refineries, the required uncertainty is related to the total uncertainty of all emissions from that source.				
<b>b</b>	Amount [t] of CKD or bypass dust (where relevant) leaving the kiln system over a reporting period estimated using industry best practice guidelines.				

*Status: This is the original version (as it was originally adopted).*

Manufacture of glass and mineral wool					
Carbonates (input)	Each carbonate raw material or additives associated with CO <sub>2</sub> emissions [t]	± 2,5 %	± 1,5 %		
Manufacture of ceramic products					
Carbon inputs (Method A)	Each carbonate raw material or additive associated with CO <sub>2</sub> emissions [t]	± 7,5 %	± 5 %	± 2,5 %	
Alkali oxide (Method B)	Gross production including rejected products and cullet from the kilns and shipment [t]	± 7,5 %	± 5 %	± 2,5 %	
Scrubbing	Dry CaCO <sub>3</sub> consumed [t]	± 7,5 %			
Production of pulp and paper					
Make up chemicals	Amount of CaCO <sub>3</sub> and Na <sub>2</sub> CO <sub>3</sub> [t]	± 2,5 %	± 1,5 %		
Production of carbon black					
Mass balance methodology	Each input and output material [t]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Production of ammonia					
Fuel as process input	Amount fuel used as process input [t] or [Nm <sup>3</sup> ]	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
Production of hydrogen and synthesis gas					
Fuel as process input	Amount fuel used as process input	± 7,5 %	± 5 %	± 2,5 %	± 1,5 %
<b>a</b>	For monitoring emissions from catalytic cracker regeneration (other catalyst regeneration and flexi-cokers) in mineral oil refineries, the required uncertainty is related to the total uncertainty of all emissions from that source.				
<b>b</b>	Amount [t] of CKD or bypass dust (where relevant) leaving the kiln system over a reporting period estimated using industry best practice guidelines.

	current efficiency [-]			
a	For monitoring emissions from catalytic cracker regeneration (other catalyst regeneration and flexi-cokers) in mineral oil refineries, the required uncertainty is related to the total uncertainty of all emissions from that source.			
b	Amount [t] of CKD or bypass dust (where relevant) leaving the kiln system over a reporting period estimated using industry best practice guidelines.			

## 2. Definition of tiers for calculation factors for combustion emissions

Operators shall monitor CO<sub>2</sub> emissions from all types of combustion processes taking place under all activities as listed in Annex I to Directive 2003/87/EC or included in the Union Scheme under Article 24 of that Directive using the tier definitions laid down in this section. Where fuels are used as a process input, the same rules as for combustion emissions shall apply. Where fuels form part of a mass balance in accordance with Article 25(1) of this Regulation, the tier definitions for mass balances in section 3 of this Annex apply.

Process emissions from related exhaust gas scrubbing shall be monitored in accordance with subsection C of section 1 of Annex IV.

### 2.1. Tiers for emission factors

Where a biomass fraction is determined for a mixed fuel or material, the tiers defined shall relate to the preliminary emission factor. For fossil fuels and materials the tiers shall relate to the emission factor.

- Tier 1 : The operator shall apply one of the following:
- (a) the standard factors listed in section 1 of Annex VI;
  - (b) other constant values in accordance with points (d) or (e) of Article 31(1), where no applicable value is contained in section 1 of Annex VI.
- Tier 2a : The operator shall apply country specific emission factors for the respective fuel or material in accordance with points (b) and (c) of Article 31(1).
- Tier 2b : The operator shall derive emission factors for the fuel based on one of the following established proxies, in combination with an empirical correlation as determined at least once per year in accordance with Articles 32 to 35 and 39:
- (a) density measurement of specific oils or gases, including those common to the refinery or steel industry;
  - (b) net calorific value for specific coal types.
- The operator shall ensure that the correlation satisfies the requirements of good engineering practice and that it is applied only to values of the proxy which fall into the range for which it was established.
- Tier 3 : The operator shall determine the emission factor in accordance with the relevant provisions of Articles 32 to 35.

### 2.2. Tiers for net calorific value (NCV)

- Tier 1 : The operator shall apply one of the following:
- (a) the standard factors listed in section 1 of Annex VI;

- (b) other constant values in accordance with points (d) or (e) of Article 31(1), where no applicable value is contained in section 1 of Annex VI.
- Tier 2a : The operator shall apply country specific factors for the respective fuel in accordance with points (b) or (c) of Article 31(1).
- Tier 2b : For commercially traded fuels the net calorific value as derived from the purchasing records for the respective fuel provided by the fuel supplier shall be used provided it has been derived based on accepted national or international standards.
- Tier 3 : The operator shall determine the net calorific value in accordance with Article 32 to 35.

### 2.3. *Tiers for oxidation factors*

- Tier 1 : The operator shall apply an oxidation factor of 1.
- Tier 2 : The operator shall apply oxidation factors for the respective fuel in accordance with points (b) or (c) of Article 31(1).
- Tier 3 : For fuels, the operator shall derive activity-specific factors based on the relevant carbon contents of ashes, effluents and other wastes and by-products, and other relevant incompletely oxidised gaseous forms of carbon emitted except CO. Composition data shall be determined in accordance with Article 32 to 35.

### 2.4. *Tiers for biomass fraction*

- Tier 1 : The operator shall apply a value from those published in accordance with the first subparagraph of Article 39(2) or a value determined in accordance with the second subparagraph of Article 39(2) or Article 39(3).
- Tier 2 : The operator shall determine specific factors in accordance with Article 39(1).

## 3. **Definition of tiers for calculation factors for mass balances**

Where an operator uses a mass balance in accordance with Article 25, it shall use the tier definitions of this section.

### 3.1. *Tiers for carbon content*

The operator shall apply one of the tiers listed in this point. For deriving the carbon content from an emission factor, the operator shall use the following equations:

(a) for emission factors expressed as t CO<sub>2</sub>/TJ :  $C = (EF \times NCV) / f$

(b) for emission factors expressed as t CO<sub>2</sub>/t :  $C = EF / f$

In those formulae, C is the carbon content expressed as fraction (tonne carbon per tonne product), EF is the emission factor, NCV is the net calorific value, and f is the factor laid down in Article 36(3).

Where a biomass fraction is determined for a mixed fuel or material, the tiers defined shall relate to the total carbon content. The biomass fraction of the carbon shall be determined using the tiers defined in section 2.4 of this Annex.

---

*Status: This is the original version (as it was originally adopted).*

---

- Tier 1 : The operator shall apply one of the following:
- (a) the carbon content derived from standard factors listed in Annex VI sections 1 and 2;
  - (b) other constant values in accordance with points (d) or (e) of Article 31(1), where no applicable value is contained in Annex VI sections 1 and 2.
- Tier 2a : The operator shall derive the carbon content from country specific emission factors for the respective fuel or material in accordance with points (b) or (c) of Article 31(1).
- Tier 2b : The operator shall derive the carbon content from emission factors for the fuel based on one of the following established proxies in combination with an empirical correlation as determined at least once per year in accordance with Articles 32 to 35:
- (a) density measurement of specific oils or gases common, for example, to the refinery or steel industry;
  - (b) net calorific value for specific coals types.
- The operator shall ensure that the correlation satisfies the requirements of good engineering practice and that it is applied only to values of the proxy which fall into the range for which it was established.
- Tier 3 : The operator shall determine the carbon content in accordance with the relevant provisions of Articles 32 to 35.

### 3.2. *Tiers for net calorific values*

The tiers defined in section 2.2 of this Annex shall be used.

## 4. **Definition of tiers for the calculation factors for process emissions from carbonate decomposition**

For all process emissions, where they are monitored using the standard methodology in accordance with Article 24(2), the following tier definitions for the emission factor shall be applied in the case of:

- (a) Method A : Input based, the emission factor and activity data related to the amount of material input into the process.
- (b) Method B : Output based, the emission factor and activity data related to the amount of output from the process.

### 4.1. *Tiers for the emission factor using Method A*

- Tier 1 : The determination of the amount of relevant carbonates in each relevant input material shall be carried out according Articles 32 to 35. Stoichiometric ratios as listed in section 2 of Annex VI shall be used to convert composition data into emission factors.

### 4.2. *Tiers for the conversion factor using Method A*

- Tier 1 : A conversion factor of 1 shall be used.
- Tier 2 : Carbonates and other carbon leaving the process shall be considered by means of a conversion factor with a value between 0 and 1. The operator may assume complete conversion for one or several inputs and attribute unconverted materials or other carbon to the remaining inputs.

The additional determination of relevant chemical parameters of the products shall be carried out in accordance with Articles 32 to 35.

4.3. *Tiers for the emission factor using Method B*

- Tier 1 : The operator shall apply the standard factors listed in Annex VI, section 2, Table 3.
- Tier 2 : The operator shall apply a country specific emission factor in accordance with points (b) or (c) of Article 31(1).
- Tier 3 : The determination of the amount of relevant metal oxides stemming from the decomposition of carbonates in the product shall be carried out in accordance with Articles 32 to 35. Stoichiometric ratios referred to in Annex VI, section 2, Table 3 shall be used to convert composition data into emission factors assuming that all of the relevant metal oxides have been derived from respective carbonates.

4.4. *Tiers for the conversion factor using Method B*

- Tier 1 : A conversion factor of 1 shall be used.
- Tier 2 : The amount of non-carbonate compounds of the relevant metals in the raw materials, including return dust or fly ash or other already calcined materials, shall be reflected by means of conversion factors with a value between 0 and 1 with a value of 1 corresponding to a full conversion of raw material carbonates into oxides. The additional determination of relevant chemical parameters of the process inputs shall be carried out in accordance with Articles 32 to 35.

## ANNEX III

### Monitoring methodologies for aviation (Article 52 and Article 56)

#### 1. Calculation methodologies for the determination of GHGs in the aviation sector *Method A*

The operator shall use the following formula:

Actual fuel consumption for each flight [t] = Amount of fuel contained in aircraft tanks once fuel uplift for the flight is complete [t] – Amount of fuel contained in aircraft tanks once fuel uplift for subsequent flight is complete [t] + Fuel uplift for that subsequent flight [t]

Where there is no fuel uplift for the flight or subsequent flight, the amount of fuel contained in aircraft tanks shall be determined at block-off for the flight or subsequent flight. In the exceptional case that an aircraft performs activities other than a flight, including undergoing major maintenance involving the emptying of the tanks, after the flight for which fuel consumption is being monitored, the aircraft operator may substitute the quantity ‘Amount of fuel contained in aircraft tanks once fuel uplift for subsequent flight is complete + Fuel uplift for that subsequent flight’ with the ‘Amount of fuel remaining in tanks at the start of the subsequent activity of the aircraft’, as recorded by technical logs.

#### *Method B*

The operator shall use the following formula:

Actual fuel consumption for each flight [t] = Amount of fuel remaining in aircraft tanks at block-on at the end of the previous flight [t] + Fuel uplift for the flight [t] - Amount of fuel contained in tanks at block-on at the end of the flight [t]

The moment of block-on may be considered equivalent to the moment of engine shut down. Where an aircraft does not perform a flight previous to the flight for which fuel consumption is being monitored, the aircraft operator may substitute the quantity 'Amount of fuel remaining in aircraft tanks at block-on at the end of the previous flight' with the 'Amount of fuel remaining in aircraft tanks at the end of the previous activity of the aircraft', as recorded by technical logs.

## 2. Tier levels for fuel consumption

TABLE 1

### Tier levels for activity data for aviation emissions

	Tier level	
	Tier 1	Tier 2
<b>Maximum uncertainty regarding the overall amount of fuel in tonnes consumed by an aircraft operator over the reporting period</b>	± 5,0 %.	± 2,5 %.

## 3. Emission factors for standard fuels

TABLE 2

### Aviation fuel CO<sub>2</sub> emission factors

Fuel	Emission factor (t CO <sub>2</sub> /t fuel)
Aviation gasoline (AvGas)	3,1
Jet gasoline (Jet B)	3,1
Jet kerosene (Jet A1 or Jet A)	3,15

## 4. Calculation of Great Circle Distance

Distance [km] = Great Circle Distance [km] + 95 km

The Great Circle Distance shall be the shortest distance between any two points on the surface of the Earth, which shall be approximated using the system referred to in Article 3.7.1.1 of Annex 15 to the Chicago Convention (WGS 84).

The latitude and longitude of aerodromes shall be taken either from aerodrome location data published in Aeronautical Information Publications (AIP) in compliance with Annex 15 to the Chicago Convention or from a source using AIP data.

Distances calculated by software or by a third party may also be used, provided that the calculation methodology is based on the formula set out in this section, AIP data and WGS 84 requirements.

## ANNEX IV

**Activity-specific monitoring methodologies related to installations (Article 20(2))****1. Specific monitoring rules for emissions from combustion processes****A. Scope**

Operators shall monitor CO<sub>2</sub> emissions from all types of combustion processes taking place under all activities as listed in Annex I to Directive 2003/87/EC or included in the Union Scheme under Article 24 of that Directive including the related scrubbing processes using the rules laid down in this Annex. Any emissions from fuels used as process input shall be treated like combustion emissions with regard to monitoring and reporting methodologies, without prejudice to other classifications applied to emissions.

The operator shall not monitor and report emissions from internal combustion engines for transportation purposes. The operator shall assign all emissions from the combustion of fuels at the installation to the installation, regardless of exports of heat or electricity to other installations. The operator shall not assign emissions associated with the production of heat or electricity that is imported from other installations to the importing installation.

The operator shall include at least the following emission sources: boilers, burners, turbines, heaters, furnaces, incinerators, kilns, ovens, dryers, engines, flares, scrubbers (process emissions) and any other equipment or machinery that uses fuel, excluding equipment or machinery with combustion engines that are used for transportation purposes.

**B. Specific monitoring rules**

The emissions from combustion processes shall be calculated in accordance with Article 24(1), unless the fuels are included in a mass balance in accordance with Article 25. The tiers defined in section 2 of Annex II shall apply. In addition, process emissions from flue gas scrubbing shall be monitored using the provisions laid down in subsection C.

For emissions from flares special requirements shall apply, as laid down in subsection D of this section.

Combustion processes taking place in gas processing terminals may be monitored using a mass balance in accordance with Article 25.

**C. Flue gas scrubbing**

Process CO<sub>2</sub> emissions from the use of carbonate for acid gas scrubbing from the flue gas stream shall be calculated in accordance with Article 24(2) on the basis of carbonate consumed, Method A as follows, or gypsum produced, Method B as follows.

**Method Emission factor****A:**

Tier 1 : The emission factor shall be determined from stoichiometric ratios as laid down in section 2 of Annex VI. The determination of the amount of CaCO<sub>3</sub> and MgCO<sub>3</sub> in the relevant input material shall be carried out using best industry practice guidelines.

**Method Emission factor****B:**

Tier 1 : The emission factor shall be the stoichiometric ratio of dry gypsum (CaSO<sub>4</sub> × 2H<sub>2</sub>O) to CO<sub>2</sub> emitted: 0,2558 t CO<sub>2</sub>/t gypsum.

#### D. *Flares*

When calculating emissions from flares the operator shall include routine flaring and operational flaring (trips, start-up and shutdown as well as emergency relieves). The operator shall also include inherent CO<sub>2</sub> in accordance with Article 48.

By way of derogation from section 2.1 of Annex II, tiers 1 and 2b for the emission factor shall be defined as follows:

- Tier 1 : The operator shall use a reference emission factor of 0,00393 t CO<sub>2</sub>/Nm<sup>3</sup> derived from the combustion of pure ethane used as a conservative proxy for flare gases.
- Tier 2b : Installation-specific emission factors shall be derived from an estimate of the molecular weight of the flare stream, using process modelling based on industry standard models. By considering the relative proportions and the molecular weights of each of the contributing streams, a weighted annual average figure shall be derived for the molecular weight of the flare gas.

By way of derogation from section 2.3 of Annex II, only tiers 1 and 2 shall be applied for the oxidation factor in the case of flares.

### 2. **Refining of Mineral Oil as Listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall monitor and report all CO<sub>2</sub> emissions from combustion and production processes as occurring in refineries.

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: boilers, process heaters/treaters, internal combustion engines/turbines, catalytic and thermal oxidisers, coke calcining kilns, firewater pumps, emergency/standby generators, flares, incinerators, crackers, hydrogen production units, Claus process units, catalyst regeneration (from catalytic cracking and other catalytic processes) and cokers (flexi-coking, delayed coking).

#### B. *Specific monitoring rules*

The monitoring of mineral oil refining activities shall be carried out in accordance with section 1 of this Annex for combustion emissions including flue gas scrubbing. The operator may choose to use the mass balance methodology in accordance with Article 25 for the whole refinery or individual process units such as heavy oil gasification or calcinations plants. Where combinations of standard methodology and mass balance are used, the operator shall provide evidence to the competent authority demonstrating the completeness of emissions covered, and that no double counting of emissions occurs.

By way of derogation from Article 24 and 25, emissions from catalytic cracker regeneration, other catalyst regeneration and flexi-cokers shall be monitored using a mass balance, taking into account the state of the input air and the flue gas. All CO in the flue gas shall be accounted for as CO<sub>2</sub>, applying the mass relation: t CO<sub>2</sub> = t CO \* 1,571. The analysis of input air and flue gases and the choice of tiers shall be in accordance with the provisions of Articles 32 to 35. The specific calculation methodology shall be approved by the competent authority.

By way of derogation from Article 24, emissions from hydrogen production shall be calculated as activity data (expressed as tonnes of hydrocarbon feed) multiplied by the emission factor (expressed as t CO<sub>2</sub>/t feed). The following tiers are defined for the emission factor:

- Tier 1 : The operator shall use a reference value of 2,9 t CO<sub>2</sub> per tonne feed processed, conservatively based on ethane.
- Tier 2 : The operator shall use an activity-specific emission factor calculated from the carbon content of the feed gas determined in accordance with Articles 32 to 35.

### 3. **Production of coke as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: raw materials (including coal or petroleum coke), conventional fuels (including natural gas), process gases (including blast furnace gas — BFG), other fuels and waste gas scrubbing.

#### B. *Specific monitoring rules*

For the monitoring of emissions from the production of coke, the operator may choose to use a mass balance in accordance with Article 25 and section 3 of Annex II, or the standard methodology in accordance with Article 24 and sections 2 and 4 of Annex II.

### 4. **Metal ore roasting and sintering as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: raw materials (calcination of limestone, dolomite and carbonatic iron ores, including FeCO<sub>3</sub>), conventional fuels (including natural gas and coke/coke breeze), process gases (including coke oven gas — COG, and blast furnace gas — BFG), process residues used as input material including filtered dust from the sintering plant, the converter and the blast furnace, other fuels and flue gas scrubbing.

#### B. *Specific monitoring rules*

For the monitoring of emissions from metal ore roasting, sintering or pelletisation, the operator may choose to use a mass balance in accordance with Article 25 and section 3 of Annex II or the standard methodology in accordance with Article 24 and sections 2 and 4 of Annex II.

### 5. **Production of pig iron and steel as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: raw materials (calcination of limestone, dolomite and carbonatic iron ores, including FeCO<sub>3</sub>), conventional fuels (natural gas, coal and coke), reducing agents (including coke, coal and plastics), process gases (coke oven gas — COG, blast furnace gas — BFG and basic oxygen furnace gas — BOFG), consumption of graphite electrodes, other fuels and waste gas scrubbing.

#### B. *Specific monitoring rules*

For the monitoring of emissions from production of pig iron and steel, the operator may choose to use a mass balance in accordance with Article 25 and section 3 of Annex II, or the standard methodology in accordance with Article 24 and sections 2 and 4 of Annex II, at least for a part of the source streams, avoiding any gaps or double counting of emissions.

By way of derogation from section 3.1 of Annex II, tier 3 for the carbon content is defined as follows:

Tier 3 : The operator shall derive the carbon content of input or output stream following Articles 32 to 35 in respect to the representative sampling of fuels, products and by-products, the determination of their carbon contents and biomass fraction. The operator shall base the carbon content of products or semi-finished products on annual analyses following Articles 32 to 35 or derive the carbon content from mid-range composition values as specified by relevant international or national standards.

**6. Production or processing of ferrous and non-ferrous metals as listed in Annex I to Directive 2003/87/EC**

**A. Scope**

The operator shall not apply the provisions in this section for the monitoring and reporting of CO<sub>2</sub> emissions from the production of pig iron and steel and primary aluminium.

The operator shall consider at least the following potential emission sources for CO<sub>2</sub> emissions: conventional fuels; alternative fuels including plastics granulated material from post shredder plants; reducing agents including coke, graphite electrodes; raw materials including limestone and dolomite; carbon containing metal ores and concentrates; and secondary feed materials.

**B. Specific monitoring rules**

Where carbon stemming from fuels or input materials used at this installation remains in the products or other outputs of the production, the operator shall use a mass balance in accordance with Article 25 and section 3 of Annex II. Where this is not the case the operator shall calculate combustion and process emission separately using the standard methodology in accordance with Article 24 and sections 2 and 4 of Annex II.

Where a mass balance is used, the operator may choose to include emissions from combustion processes in the mass balance or to use the standard methodology in accordance with Article 24 and section 1 of this Annex for a part of the source streams, avoiding any gaps or double counting of emissions.

**7. CO<sub>2</sub> Emissions from production or processing of primary aluminium as listed in Annex I to Directive 2003/87/EC**

**A. Scope**

The operator shall apply the provisions of this section to the monitoring and reporting of CO<sub>2</sub> emissions from the production of electrodes for primary aluminium smelting, including stand-alone plants for the production of such electrodes.

The operator shall consider at least the following potential sources for CO<sub>2</sub> emissions: fuels for the production of heat or steam, electrode production, reduction of Al<sub>2</sub>O<sub>3</sub> during electrolysis which is related to electrode consumption, and use of soda ash or other carbonates for waste gas scrubbing.

The associated emissions of perfluorocarbons — PFCs, resulting from anode effects, including fugitive emissions, shall be monitored in accordance with section 8 of this Annex.

**B. Specific monitoring rules**

The operator shall determine CO<sub>2</sub> emissions from the production or processing of primary aluminium using the mass balance methodology in accordance with Article 25. The mass balance methodology shall consider all carbon in inputs, stocks, products and other exports from

the mixing, forming, baking and recycling of electrodes as well as from electrode consumption in electrolysis. Where pre-baked anodes are used, either separate mass balances for production and consumption may be applied, or one common mass balance taking into account both production and consumption of electrodes. In the case of Söderberg cells, the operator shall use one common mass balance.

For emissions from combustion processes the operator may choose to include them in the mass balance or to use the standard methodology in accordance with Article 24 and section 1 of this Annex at least for a part of the source streams, avoiding any gaps or double counting of emissions.

#### 8. **PFC emissions from production or processing of primary aluminium as listed in Annex I to Directive 2003/87/EC**

##### A. *Scope*

The operator shall apply the following for emissions of perfluorocarbons (PFCs) resulting from anode effects including fugitive emissions of PFCs. For associated CO<sub>2</sub> emissions, including emissions from electrode production, the operator shall apply section 7 of this Annex.

##### B. *Determination of PFC emissions*

PFC emissions shall be calculated from the emissions measurable in a duct or stack ('point source emissions') as well as fugitive emissions using the collection efficiency of the duct:

$$\text{PFC emissions (total)} = \text{PFC emissions (duct)/collection efficiency}$$

The collection efficiency shall be measured when the installation-specific emission factors are determined. For its determination the most recent version of the guidance mentioned under Tier 3 of section 4.4.2.4 of the 2006 IPCC Guidelines shall be used.

The operator shall calculate emissions of CF<sub>4</sub> and C<sub>2</sub>F<sub>6</sub> emitted through a duct or stack using one of the following methods:

- (a) Method A where the anode effect minutes per cell-day are recorded;
- (b) Method B where the anode effect overvoltage is recorded.

#### **Calculation Method**

##### **Method**

**A —**

The operator shall use the following equations for determining PFC emissions:

$$\text{CF}_4 \text{ emissions [t]} = \text{AEM} \times (\text{SEF}_{\text{CF}_4}/1\ 000) \times \text{Pr}_{\text{Al}}$$

$$\text{C}_2\text{F}_6 \text{ emissions [t]} = \text{CF}_4 \text{ emissions} * \text{F}_{\text{C}_2\text{F}_6}$$

Where:

AEM	= Anode effect minutes/cell-day;
SEF <sub>CF4</sub>	= Slope emission factor [(kg CF <sub>4</sub> /t Al produced)/(anode effect minutes/cell-day)]. Where different cell-types are used, different SEF may be applied as appropriate;
Pr <sub>Al</sub>	= Annual production of primary Aluminium [t];
F <sub>C2F6</sub>	= Weight fraction of C <sub>2</sub> F <sub>6</sub> (t C <sub>2</sub> F <sub>6</sub> /t CF <sub>4</sub> ).

The anode effect minutes per cell-day shall express the frequency of anode effects (number anode effects/cell-day) multiplied by the average duration of anode effects (anode effect minutes/occurrence):

$$\text{AEM} = \text{frequency} \times \text{average duration}$$

- Emission factor : The emission factor for  $\text{CF}_4$  (slope emission factor,  $\text{SEF}_{\text{CF}_4}$ ) expresses the amount [kg] of  $\text{CF}_4$  emitted per tonne of aluminium produced per anode effect minute/cell-day. The emission factor (weight fraction  $F_{\text{C}_2\text{F}_6}$ ) of  $\text{C}_2\text{F}_6$  expresses the amount [t] of  $\text{C}_2\text{F}_6$  emitted proportionate to the amount [t] of  $\text{CF}_4$  emitted.
- Tier 1 : The operator shall use technology-specific emission factors from Table 1 of this section of Annex IV.
- Tier 2 : The operator shall use installation-specific emission factors for  $\text{CF}_4$  and  $\text{C}_2\text{F}_6$  established through continuous or intermittent field measurements. For the determination of those emission factors the operator shall use the most recent version of the guidance mentioned under tier 3 of section 4.4.2.4 of the 2006 IPCC Guidelines<sup>(2)</sup>. The operator shall determine each emission factor with a maximum uncertainty of  $\pm 15\%$ .

The operator shall determine the emission factors at least every three years or earlier where necessary due to relevant changes at the installation. Relevant changes shall include a change in the distribution of anode effect duration, or a change in the control algorithm affecting the mix of the types of anode effects or the nature of the anode effect termination routine.

Table 1:

**TECHNOLOGY-SPECIFIC EMISSION FACTORS RELATED  
TO ACTIVITY DATA FOR THE SLOPE METHOD**

<b>Technology</b>	<b>Emission factor for <math>\text{CF}_4</math> (<math>\text{SEF}_{\text{CF}_4}</math>)[(kg <math>\text{CF}_4</math>/t Al)/ (AE-Mins/cell-day)]</b>	<b>Emission factor for <math>\text{C}_2\text{F}_6</math> (<math>F_{\text{C}_2\text{F}_6}</math>)[t <math>\text{C}_2\text{F}_6</math>/t <math>\text{CF}_4</math>]</b>
Centre Worked Prebake (CWPB)	0,143	0,121
Vertical Stud Søderberg (VSS)	0,092	0,053

**Calculation of Overvoltage Method**  
**B —**

Where the anode effect overvoltage is measured, the operator shall use the following equations for the determination of PFC emissions:

$$\text{CF}_4 \text{ emissions [t]} = \text{OVC} \times (\text{AEO/CE}) \times \text{Pr}_{\text{Al}} \times 0,001$$

$$\text{C}_2\text{F}_6 \text{ emissions [t]} = \text{CF}_4 \text{ emissions} \times F_{\text{C}_2\text{F}_6}$$

Where:

OVC = Overvoltage coefficient ('emission factor') expressed as kg  $\text{CF}_4$  per tonne of aluminium produced per mV overvoltage;

AEO	= Anode effect overvoltage per cell [mV] determined as the integral of (time × voltage above the target voltage) divided by the time (duration) of data collection;
CE	= Average current efficiency of aluminium production [%];
Pr <sub>Al</sub>	= Annual production of primary Aluminium [t];
F <sub>C2F6</sub>	= Weight fraction of C <sub>2</sub> F <sub>6</sub> (t C <sub>2</sub> F <sub>6</sub> /t CF <sub>4</sub> );

The term AEO/CE (Anode effect overvoltage/current efficiency) expresses the time-integrated average anode effect overvoltage [mV overvoltage] per average current efficiency [%].

Emission factor	: The emission factor for CF <sub>4</sub> ('overvoltage coefficient' OVC) shall express the amount [kg] of CF <sub>4</sub> emitted per tonne of aluminium produced per millivolt overvoltage [mV]. The emission factor of C <sub>2</sub> F <sub>6</sub> (weight fraction F <sub>C2F6</sub> ) shall express the amount [t] of C <sub>2</sub> F <sub>6</sub> emitted proportionate to the amount [t] of CF <sub>4</sub> emitted.
Tier 1	: The operator shall apply technology-specific emission factors from Table 2 of this section of Annex IV.
Tier 2	: The operator shall use installation-specific emission factors for CF <sub>4</sub> [(kg CF <sub>4</sub> /t Al)/(mV)] and C <sub>2</sub> F <sub>6</sub> [t C <sub>2</sub> F <sub>6</sub> /t CF <sub>4</sub> ] established through continuous or intermittent field measurements. For the determination of those emission factors, the operator shall use the most recent version of the guidance mentioned under tier 3 of section 4.4.2.4 of the 2006 IPCC Guidelines. The operator shall determine the emission factors with a maximum uncertainty of ± 15 % each.

The operator shall determine the emission factors at least every three years or earlier where necessary due to relevant changes at the installation. Relevant changes shall include a change in the distribution of anode effect duration or a change in the control algorithm affecting the mix of the types of anode effects or the nature of the anode effect termination routine.

Table 2:

**TECHNOLOGY-SPECIFIC EMISSION FACTORS  
RELATED TO OVERVOLTAGE ACTIVITY DATA**

<b>Technology</b>	<b>Emission factor for CF<sub>4</sub>[(kg CF<sub>4</sub>/t Al)/mV]</b>	<b>Emission factor for C<sub>2</sub>F<sub>6</sub>[t C<sub>2</sub>F<sub>6</sub>/t CF<sub>4</sub>]</b>
Centre Worked Prebake (CWPB)	1,16	0,121
Vertical Stud Søderberg (VSS)	N.A.	0,053

**C. Determination of CO<sub>2(e)</sub> emissions**

The operator shall calculate CO<sub>2(e)</sub> emissions from CF<sub>4</sub> and C<sub>2</sub>F<sub>6</sub> emissions as follows, using the global warming potentials listed in Annex VI, section 3, Table 6:

$$\text{PFC emissions [t CO}_{2(e)}\text{]} = \text{CF}_4 \text{ emissions [t]} * \text{GWP}_{\text{CF}_4} + \text{C}_2\text{F}_6 \text{ emissions [t]} * \text{GWP}_{\text{C}_2\text{F}_6}$$

**9. Production of cement clinker as listed in Annex I to Directive 2003/87/EC**

**A. Scope**

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: calcination of limestone in the raw materials, conventional fossil kiln fuels, alternative fossil-based kiln fuels and raw materials, biomass kiln fuels (biomass wastes), non-kiln fuels, organic carbon content of limestone and shales and raw materials used for waste gas scrubbing.

**B. *Specific monitoring rules***

Emissions from combustion shall be monitored in accordance with section 1 of this Annex. Process emissions from raw meal components shall be monitored in accordance with section 4 of Annex II based on the carbonate content of the process input (calculation Method A) or on the amount of clinker produced (calculation Method B). Carbonates to be taken into account shall at least include CaCO<sub>3</sub>, MgCO<sub>3</sub> and FeCO<sub>3</sub>.

CO<sub>2</sub> emissions related to dust removed from the process and organic carbon in the raw materials shall be added in accordance with subsections C and D of this section of Annex IV.

***Calculation Method A: Kiln Input Based***

***Method***

***A:***

Where cement kiln dust (CKD) and bypass dust leave the kiln system the operator shall not consider the related raw material as process input, but calculate emissions from CKD in accordance with subsection C.

Unless the raw meal is characterised, the operator shall apply the uncertainty requirements for activity data separately to each of the relevant carbon-bearing kiln inputs, avoiding double counting or omissions from returned or by-passed materials. Where activity data is determined based on the clinker produced, the net amount of raw meal may be determined by means of a site-specific empirical raw meal/clinker ratio. That ratio shall be updated at least once per year applying industry best practice guidelines.

***Calculation Method B: Clinker Output Based***

***Method***

***B:***

The operator shall determine activity data as the clinker production [t] over the reporting period in one of the following ways:

- (a) by direct weighing of clinker;
- (b) based on cement deliveries, by material balance taking into account dispatch of clinker, clinker supplies as well as clinker stock variation, using the following formula:

$$\text{clinker produced [t]} = ((\text{cement deliveries [t]} - \text{cement stock variation [t]}) * \text{clinker/cement ratio [t clinker/t cement]}) - (\text{clinker supplied [t]}) + (\text{clinker dispatched [t]}) - (\text{clinker stock variation [t]}).$$

The operator shall either derive the cement/clinker ratio for each of the different cement products based on the provisions of Articles 32 to 35 or calculate the ratio from the difference of cement deliveries and stock changes and all materials used as additives to the cement including by-pass dust and cement kiln dust.

By way of derogation from section 4 of Annex II, tier 1 for the emission factor shall be defined as follows:

Tier 1 : The operator shall apply an emission factor of 0,525 t CO<sub>2</sub>/t clinker.

**C. *Emissions related to discarded dust***

The operator shall add CO<sub>2</sub> emissions, from bypass dust or cement kiln dust (CKD) leaving the kiln system, corrected for a partial calcination ratio of CKD calculated as process emissions in accordance with Article 24(2). By way of derogation from section 4 of Annex II, tiers 1 and 2 for the emission factor shall be defined as follows:

- Tier 1 : The operator shall apply an emission factor of 0,525 t CO<sub>2</sub>/t dust.  
 Tier 2 : The operator shall determine the emission factor (EF) at least once annually following Articles 32 to 35 and using the following formula:

$$EF_{CKD} = \frac{\frac{EF_{CKD} \cdot d}{1 + EF_{CKD}}}{1 - \frac{EF_{CKD} \cdot d}{1 + EF_{CKD}}}$$

Where:

- EF<sub>CKD</sub> = Emission factor of partially calcined cement kiln dust [t CO<sub>2</sub>/t CKD];  
 EF<sub>CKi</sub> = Installation-specific emission factor of clinker [t CO<sub>2</sub>/t clinker];  
 d = Degree of CKD calcination (released CO<sub>2</sub> as % of total carbonate CO<sub>2</sub> in the raw mix).

Tier 3 for the emission factor is not applicable.

#### D. *Emissions from non-carbonate carbon in raw meal*

The operator shall determine the emissions from non-carbonate carbon at least from limestone, shale or alternative raw materials (for example, fly ash) used in the raw meal in the kiln in accordance with Article 24(2).

The following tier definitions for the emission factor shall apply:

- Tier 1 : The content of non-carbonate carbon in the relevant raw material shall be estimated using industry best practice guidelines.  
 Tier 2 : The content of non-carbonate carbon in the relevant raw material shall be determined at least annually following the provisions of Article 32 to 35.

The following tier definitions for the conversion factor shall apply:

- Tier 1 : A conversion factor of 1 shall be applied.  
 Tier 2 : The conversion factor shall be calculated applying best industry practice.

### 10. **Production of lime or calcination of dolomite or magnesite as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: calcination of limestone, dolomite or magnesite in the raw materials, conventional fossil kiln fuels, alternative fossil-based kiln fuels and raw materials, biomass kiln fuels (biomass wastes) and other fuels.

Where the burnt lime and the CO<sub>2</sub> stemming from the limestone are used for purification processes, such that approximately the same amount of CO<sub>2</sub> is bound again, the decomposition of carbonates as well as the purification process shall not be required to be included separately in the monitoring plan of the installation.

**B. *Specific monitoring rules***

Emissions from combustion shall be monitored in accordance with section 1 of this Annex. Process emissions from raw materials shall be monitored in accordance with section 4 of Annex II. Carbonates of calcium and magnesium shall be always taken into account. Other carbonates and organic carbon in the raw material shall be taken into account, where relevant.

For the input based methodology, carbonate content values shall be adjusted for the respective moisture and gangue content of the material. In the case of magnesia production, other magnesium bearing minerals than carbonates must be taken into account, as appropriate.

Double counting or omissions resulting from returned or by-pass material must be avoided. When applying Method B, lime kiln dust shall be considered a separate source stream where relevant.

Where CO<sub>2</sub> is used in the plant or transferred to another plant for the production of PCC (precipitated calcium carbonate), that amount of CO<sub>2</sub> shall be considered emitted by the installation producing the CO<sub>2</sub>.

**11. *Manufacture of glass, glass fibre or mineral wool insulation material as listed in Annex I to Directive 2003/87/EC*****A. *Scope***

The operator shall apply the provisions in this section also to installations for the production of water glass and stone/rock wool.

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: decomposition of alkali- and alkali earth carbonates as the result of melting the raw material, conventional fossil fuels, alternative fossil-based fuels and raw materials, biomass fuels (biomass wastes), other fuels, carbon containing additives including coke, coal dust and graphite, post-combustion of flue gases and flue gas scrubbing.

**B. *Specific monitoring rules***

Emissions from combustion, including flue gas scrubbing, and from process materials including coke, graphite and coal dust shall be monitored in accordance with section 1 of this Annex. Process emissions from raw materials shall be monitored in accordance with section 4 of Annex II. Carbonates to be taken into account include at least CaCO<sub>3</sub>, MgCO<sub>3</sub>, Na<sub>2</sub>CO<sub>3</sub>, NaHCO<sub>3</sub>, BaCO<sub>3</sub>, Li<sub>2</sub>CO<sub>3</sub>, K<sub>2</sub>CO<sub>3</sub>, and SrCO<sub>3</sub>. Only Method A shall be used.

The following tier definitions for the emission factor shall apply:

- Tier 1 : Stoichiometric ratios as listed in section 2 of Annex VI shall be used. The purity of relevant input materials shall be determined by means of industry best practice.
- Tier 2 : The determination of the amount of relevant carbonates in each relevant input material shall be carried out in accordance with Articles 32 to 35.

For the conversion factor, only tier 1 shall be applicable.

**12. *Manufacture of ceramic products as listed in Annex I to Directive 2003/87/EC*****A. *Scope***

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: kiln fuels, calcination of limestone/dolomite and other carbonates in the raw material, limestone and other

carbonates for reducing air pollutants and other flue gas cleaning, fossil/biomass additives used to induce porosity including polystyrol, residues from paper production or sawdust, fossil organic material in the clay and other raw materials.

#### B. *Specific monitoring rules*

Emissions from combustion including flue gas scrubbing shall be monitored in accordance with section 1 of this Annex. Process emissions from raw meal components shall be monitored in accordance with section 4 of Annex II. For ceramics based on purified or synthetic clays the operator may use either Method A or Method B. For ceramic products based on unprocessed clays and whenever clays or additives with significant organic content are used, the operator shall use Method A. Carbonates of calcium shall be always taken into account. Other carbonates and organic carbon in the raw material shall be taken into account, where relevant.

By way of derogation from section 4 of Annex II, the following tier definitions for emission factors for process emissions shall apply:

##### **Method A (Input based)**

- Tier 1 : A conservative value of 0,2 tonnes CaCO<sub>3</sub> (corresponding to 0,08794 tonnes of CO<sub>2</sub>) per tonne of dry clay shall be applied for the calculation of the emission factor instead of results of analyses.
- Tier 2 : An emission factor for each source stream shall be derived and updated at least once per year using best industry practice reflecting site-specific conditions and the product mix of the installation.
- Tier 3 : The determination of the composition of the relevant raw materials shall be carried out in accordance with Articles 32 to 35.

##### **Method B (Output based)**

- Tier 1 : A conservative value of 0,123 tonnes of CaO (corresponding to 0,09642 tonnes of CO<sub>2</sub>) per tonne of product shall be applied for the calculation of the emission factor instead of the results of analyses.
- Tier 2 : An emission factor shall be derived and updated at least once per year using best industry practice reflecting site-specific conditions and the product mix of the installation.
- Tier 3 : The determination of the composition of the products shall be carried out in accordance with Articles 32 to 35.

By way of derogation from section 1 of this Annex, for the scrubbing of flue gases the following tier for the emission factor shall apply:

- Tier 1 : The operator shall apply the stoichiometric ratio of CaCO<sub>3</sub> as shown in section 2 of Annex VI.

For scrubbing, no other tier and no conversion factor shall be used. Double counting from used limestone recycled as raw material in the same installation shall be avoided.

### 13. **Production of gypsum products and plaster boards as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least CO<sub>2</sub> emissions from all types of combustion activities.

#### B. *Specific monitoring rules*

Emissions from combustion shall be monitored in accordance with section 1 of this Annex.

### 14. **Pulp and paper production as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least the following potential sources of CO<sub>2</sub> emissions: boilers, gas turbines, and other combustion devices producing steam or power, recovery boilers and other devices burning spent pulping liquors, incinerators, lime kilns and calciners, waste gas scrubbing and fuel-fired dryers (such as infrared dryers).

#### B. *Specific monitoring rules*

The monitoring of emissions from combustion including flue gas scrubbing shall be carried out in accordance with section 1 of this Annex.

Process emissions from raw materials used as make-up chemicals, including at least limestone or soda ash, shall be monitored by Method A in accordance with section 4 of Annex II. CO<sub>2</sub> emissions from the recovery of limestone sludge in pulp production shall be assumed to be recycled biomass CO<sub>2</sub>. Only the amount of CO<sub>2</sub> proportional to the input from make-up chemicals shall be assumed to give rise to fossil CO<sub>2</sub> emissions.

Where CO<sub>2</sub> is used in the plant or transferred to another plant for the production of PCC (precipitated calcium carbonate), that amount of CO<sub>2</sub> shall be considered as emitted by the installation producing the CO<sub>2</sub>.

For emissions from make-up chemicals, the following tier definitions for the emission factor shall apply:

- Tier 1 : Stoichiometric ratios as listed in section 2 of Annex VI shall be used. The purity of relevant input materials shall be determined by means of best industry practice. The derived values shall be adjusted in accordance with the moisture and gangue content of the applied carbonate materials.
- Tier 2 : The determination of the amount of relevant carbonates in each relevant input material shall be carried out in accordance with Articles 32 to 35.

For the conversion factor, only tier 1 shall be applicable.

### 15. **Production of carbon black as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

The operator shall include at least all fuels for combustion and all fuels used as process material as sources for CO<sub>2</sub> emissions.

#### B. *Specific monitoring rules*

The monitoring of emissions from carbon black production may be monitored either as a combustion process, including flue gas scrubbing, in accordance with section 1 of this Annex or using a mass balance in accordance with Article 25 and section 3 of Annex II.

### 16. **Determination of nitrous oxide (N<sub>2</sub>O) emissions from nitric acid, adipic acid, caprolactam, glyoxal and glyoxylic acid production as listed in Annex I to Directive 2003/87/EC**

#### A. *Scope*

Each operator shall consider for each activity from which N<sub>2</sub>O emissions result, all sources emitting N<sub>2</sub>O from production processes, including where N<sub>2</sub>O emissions from production are channelled through any abatement equipment. This includes any of the following:

- (a) nitric acid — N<sub>2</sub>O emissions from the catalytic oxidation of ammonia and/or from the production NO<sub>x</sub>/N<sub>2</sub>O abatement units;
- (b) adipic acid — N<sub>2</sub>O emissions including from the oxidation reaction, any direct process production venting and/or any emissions control equipment;
- (c) glyoxal and glyoxylic acid — N<sub>2</sub>O emissions including from the process reactions, any direct process production venting and/or any emissions control equipment;
- (d) caprolactam — N<sub>2</sub>O emissions including from the process reactions, any direct process production venting and/or any emissions control equipment.

These provisions shall not apply to any N<sub>2</sub>O emissions from the combustion of fuels.

## B. Determination of N<sub>2</sub>O emissions

### B.1. Annual N<sub>2</sub>O emissions

The operator shall monitor emissions of N<sub>2</sub>O from nitric acid production using continuous emissions measurement. The operator shall monitor emissions of N<sub>2</sub>O from adipic acid, caprolactam, glyoxal and glyoxylic acid production using a measurement-based methodology for abated emissions and a calculation-based method (based on a mass balance methodology) for temporary occurrences of unabated emissions.

For each emission source where continuous emissions measurement is applied, the operator shall consider the total annual emissions to be the sum of all hourly emissions using the following formula:

$$N_2O \text{ emissions}_{\text{annual}} [\text{t}] = \Sigma [N_2O \text{ conc}_{\text{hourly}} [\text{mg}/\text{Nm}^3] * \text{flue gas flow}_{\text{hourly}} [\text{Nm}^3/\text{h}]] * 10^{-9}$$

Where:

N<sub>2</sub>O emissions<sub>annual</sub> = total annual emissions of N<sub>2</sub>O from the emission source in tonnes N<sub>2</sub>O

N<sub>2</sub>O conc<sub>hourly</sub> = hourly concentrations of N<sub>2</sub>O in mg/Nm<sup>3</sup> in the flue gas flow measured during operation

Flue gas flow = flue gas flow determined in Nm<sup>3</sup>/h for each hourly concentration

### B.2. Hourly N<sub>2</sub>O emissions

The operator shall calculate annual average hourly N<sub>2</sub>O emissions for each source where continuous emission measurement is applied using the following equation:

$$N_2O \text{ emissions}_{\text{av hourly}} [\text{kg}/\text{h}] = \frac{\Sigma (N_2O \text{ conc}_{\text{hourly}} [\text{mg}/\text{Nm}^3] * \text{flue gas flow} [\text{Nm}^3/\text{h}] * 10^{-6})}{\text{Hours of operation} [\text{h}]}$$

Where:

N<sub>2</sub>O emissions<sub>av hourly</sub> = annual average hourly N<sub>2</sub>O emissions in kg/h from the source;

N<sub>2</sub>O conc<sub>hourly</sub> = hourly concentrations of N<sub>2</sub>O in mg/Nm<sup>3</sup> in the flue gas flow measured during operation;

Flue gas flow = flue gas flow determined in Nm<sup>3</sup>/h for each hourly concentration.

The operator shall determine hourly N<sub>2</sub>O concentrations [mg/Nm<sup>3</sup>] in the flue gas from each emission source using a measurement-based methodology at a representative point, after the NO<sub>x</sub>/N<sub>2</sub>O abatement equipment, where abatement is used. The operator shall apply techniques

capable of measuring N<sub>2</sub>O concentrations of all emission sources during both abated and unabated conditions. Where uncertainties increase during such periods, the operator shall take them into account in the uncertainty assessment.

The operator shall adjust all measurements to a dry gas basis where required and report them consistently.

### B.3. Determination of flue gas flow

The operator shall use the methods for monitoring flue gas flow set out in Article 43(5) of this Regulation for measuring the flue gas flow for N<sub>2</sub>O emissions monitoring. For nitric acid production, the operator shall apply the method in accordance with point (a) of Article 43(5) unless it is technically not feasible. In that case and upon approval by the competent authority, the operator shall apply an alternative method, including by a mass balance methodology based on significant parameters such as ammonia input load, or determination of flow by continuous emissions flow measurement.

The flue gas flow shall be calculated in accordance with the following formula:

$$V_{\text{flue gas flow}} [\text{Nm}^3/\text{h}] = V_{\text{air}} * (1 - O_{2,\text{air}})/(1 - O_{2,\text{flue gas}})$$

Where:

$V_{\text{air}}$	=	Total input air flow in Nm <sup>3</sup> /h at standard conditions;
$O_{2,\text{air}}$	=	Volume fraction of O <sub>2</sub> in dry air [= 0,2095];
$O_{2,\text{flue gas}}$	=	Volume fraction of O <sub>2</sub> in the flue gas.

The  $V_{\text{air}}$  shall be calculated as the sum of all air flows entering the nitric acid production unit.

The operator shall apply the following formula, unless stated otherwise in its monitoring plan:

$$V_{\text{air}} = V_{\text{prim}} + V_{\text{sec}} + V_{\text{seal}}$$

Where:

$V_{\text{prim}}$	=	Primary input air flow in Nm <sup>3</sup> /h at standard conditions;
$V_{\text{sec}}$	=	Secondary input air flow in Nm <sup>3</sup> /h at standard conditions;
$V_{\text{seal}}$	=	Seal input air flow in Nm <sup>3</sup> /h at standard conditions.

The operator shall determine  $V_{\text{prim}}$  by continuous flow measurement before the mixing with ammonia takes place. The operator shall determine  $V_{\text{sec}}$  by continuous flow measurement, including where the measurement is before the heat recovery unit. For  $V_{\text{seal}}$  the operator shall consider the purged airflow within the nitric acid production process.

For input air streams accounting for cumulatively less than 2,5 % of the total air flow, the competent authority may accept estimation methods for the determination of that air flow rate proposed by the operator based on industry best practices.

The operator shall provide evidence through measurements under normal operating conditions that the flue gas flow measured is sufficiently homogeneous to allow for the proposed measurement method. Where non-homogeneous flow is confirmed through these measurements, the operator shall take that into account when determining appropriate monitoring methods and when calculating the uncertainty in the N<sub>2</sub>O emissions.

The operator shall adjust all measurements to a dry gas basis and report them consistently.

### B.4. Oxygen (O<sub>2</sub>) concentrations

The operator shall measure the oxygen concentrations in the flue gas where necessary for calculating the flue gas flow in accordance with subsection B.3 of this section of Annex IV. In doing so, the operator shall comply with the requirements for concentration measurements within Article 41(1) and (2). In determining the uncertainty of N<sub>2</sub>O emissions, the operator shall take the uncertainty of O<sub>2</sub> concentration measurements into account.

The operator shall adjust all measurements to a dry gas basis where required and report them consistently.

#### B.5. Calculation of N<sub>2</sub>O emissions

For specific periods of unabated emissions of N<sub>2</sub>O from adipic acid, caprolactam, glyoxal and glyoxylic acid production, including unabated emissions from venting for safety reasons and when abatement plant fails, and where continuous emissions monitoring of N<sub>2</sub>O is technically not feasible, the operator shall subject to the approval of the specific methodology by the competent authority calculate N<sub>2</sub>O emissions using a mass balance methodology. For this purpose the overall uncertainty shall be similar to the result of applying the tier requirements of Article 41(1) and (2). The operator shall base the calculation method on the maximum potential emission rate of N<sub>2</sub>O from the chemical reaction taking place at the time and the period of the emission.

The operator shall take the uncertainty in any calculated emissions for a specific emission source into account in determining the annual average hourly uncertainty for the emission source.

#### B.6. Determination of activity production rates

Production rates shall be calculated using daily production reports and hours of operation.

#### B.7. Sampling rates

Valid hourly averages or averages for shorter reference periods shall be calculated in accordance with Article 44 for:

- (a) concentration of N<sub>2</sub>O in the flue gas;
- (b) total flue gas flow where this is measured directly and where required;
- (c) all gas flows and oxygen concentrations necessary to determine the total flue gas flow indirectly.

#### C. *Determination of annual CO<sub>2</sub> equivalent — CO<sub>2(e)</sub>*

The operator shall convert the total annual N<sub>2</sub>O emissions from all emissions sources, measured in tonnes to three decimal places, to annual CO<sub>2(e)</sub> in rounded tonnes, using the following formula and the GWP values in Annex VI, section 3:

$$\text{CO}_{2(e)} [\text{t}] = \text{N}_2\text{O}_{\text{annual}}[\text{t}] * \text{GWP}_{\text{N}_2\text{O}}$$

The total annual CO<sub>2(e)</sub> generated by all emission sources and any direct CO<sub>2</sub> emissions from other emission sources included under the greenhouse gas permit shall be added to the total annual CO<sub>2</sub> emissions generated by the installation and shall be used for reporting and surrendering allowances.

Total annual emissions of N<sub>2</sub>O shall be reported in tonnes to three decimal places and as CO<sub>2(e)</sub> in rounded tonnes.

### 17. **Production of ammonia as listed in Annex I to Directive 2003/87/EC**

A. *Scope*

The operator shall include at least the following potential emission sources for CO<sub>2</sub> emissions: combustion of fuels supplying the heat for reforming or partial oxidation, fuels used as process input in the ammonia production process (reforming or partial oxidation), fuels used for other combustion processes including for the purpose of producing hot water or steam.

B. *Specific monitoring rules*

For monitoring of emissions from combustion processes and from fuels used as process inputs, the standard methodology in accordance with Article 24 and section 1 of this Annex shall be applied.

Where CO<sub>2</sub> from ammonia production is used as feedstock for the production of urea or other chemicals, or transferred out of the installation for any use not covered by Article 49(1), the related amount of CO<sub>2</sub> shall be considered as emitted by the installation producing the CO<sub>2</sub>.

**18. Production of bulk organic chemicals as listed in Annex I to Directive 2003/87/EC**

A. *Scope*

The operator shall take into account at least the following sources of CO<sub>2</sub> emissions: cracking (catalytic and non-catalytic), reforming, partial or full oxidation, similar processes which lead to CO<sub>2</sub> emissions from carbon contained in hydrocarbon based feedstock, combustion of waste gases and flaring, and the burning of fuel in other combustion processes.

B. *Specific monitoring rules*

Where the production of bulk organic chemicals is technically integrated in a mineral oil refinery, the operator of that installation shall apply the relevant provisions of section 2 of this Annex.

Notwithstanding the first subparagraph, the operator shall monitor emissions from combustion processes where the fuels used do not take part in or stem from chemical reactions for the production of bulk organic chemicals using the standard methodology in accordance with Article 24 and section 1 of this Annex. In all other cases, the operator may choose to monitor the emissions from bulk organic chemicals production by mass balance methodology in accordance with Article 25 or the standard methodology in accordance with Article 24. Where using the standard methodology, the operator shall provide evidence to the competent authority that the chosen methodology covers all relevant emissions that would also be covered by a mass-balance methodology.

For the determination of the carbon content under Tier 1, the reference emission factors as listed in Table 5 in Annex VI shall be applied. For substances not listed in Table 5 of Annex VI or other provisions of this Regulation, the operator shall calculate the carbon content from the stoichiometric carbon content in the pure substance and the concentration of the substance in the input or output stream.

**19. Production of hydrogen and synthesis gas as listed in Annex I to Directive 2003/87/EC**

A. *Scope*

The operator shall include at least the following potential emission sources for CO<sub>2</sub> emissions: fuels used in the hydrogen or synthesis gas production process (reforming or partial oxidation), and fuels used for other combustion processes including for the purpose of producing hot water

or steam. Synthesis gas produced shall be considered as source stream under the mass balance methodology.

B. *Specific monitoring rules*

For monitoring of emissions from combustion processes and from fuels used as process inputs in hydrogen production, the standard methodology in accordance with Article 24 and section 1 of this Annex shall be used.

For the monitoring of emissions from the production of synthesis gas, a mass balance in accordance with Article 25 shall be used. For emissions from separate combustion processes, the operator may choose to include them in the mass balance or to use the standard methodology in accordance with Article 24 at least for a part of the source streams, avoiding any gaps or double counting of emissions.

Where hydrogen and synthesis gas are produced at the same installation, the operator shall calculate CO<sub>2</sub> emissions using either separate methodologies for hydrogen and for synthesis gas as outlined in the first two paragraphs of this subsection, or using one common mass balance.

20. **Production of soda ash and sodium bicarbonate as listed in Annex I to Directive 2003/87/EC**

A. *Scope*

The emission sources and source streams for CO<sub>2</sub> emissions from installations for the production of soda ash and sodium bicarbonate shall include:

- (a) fuels used for combustion processes, including fuels used for the purpose of producing hot water or steam;
- (b) raw materials, including vent gas from calcination of limestone, to the extent it is not used for carbonation;
- (c) waste gases from washing or filtration steps after carbonation, to the extent it is not used for carbonation.

B. *Specific monitoring rules*

For the monitoring of emissions from the production of soda ash and sodium bicarbonate, the operator shall use a mass balance in accordance with Article 25. For emissions from combustion processes, the operator may choose to include them in the mass balance or to use the standard methodology in accordance with Article 24 at least for a part of the source streams, avoiding any gaps or double counting of emissions.

Where CO<sub>2</sub> from the production of soda ash is used for the production of sodium bicarbonate, the amount of CO<sub>2</sub> used for producing sodium bicarbonate from soda ash shall be considered as emitted by the installation producing the CO<sub>2</sub>.

21. **Determination of greenhouse gas emissions from CO<sub>2</sub> capture activities for the purposes of transport and geological storage in a storage site permitted under Directive 2009/31/EC**

A. *Scope*

CO<sub>2</sub> capture shall be performed either by a dedicated installation receiving CO<sub>2</sub> by transfer from one or more other installations, or by the same installation carrying out the activities producing the captured CO<sub>2</sub> under the same greenhouse gas emissions permit. All parts of the installation

related to CO<sub>2</sub> capture, intermediate storage, transfer to a CO<sub>2</sub> transport network or to a site for geological storage of CO<sub>2</sub> greenhouse gas emissions shall be included in the greenhouse gas emissions permit and accounted for in the associated monitoring plan. In the case of the installation carrying out other activities covered by Directive 2003/87/EC, the emissions of those activities shall be monitored in accordance with the other relevant sections of this Annex.

The operator of a CO<sub>2</sub> capture activity shall at least include the following potential sources of CO<sub>2</sub> emission:

- (a) CO<sub>2</sub> transferred to the capture installation;
- (b) combustion and other associated activities at the installation that are related to the capture activity, including fuel and input material use.

## B. *Quantification of transferred and emitted CO<sub>2</sub> amounts*

### B.1. Installation level quantification

Each operator shall calculate the emissions by taking into account the potential CO<sub>2</sub> emissions from all emission relevant processes at the installation, as well as the amount of CO<sub>2</sub> captured and transferred to the transport network, using the following formula:

$$E_{\text{capture installation}} = T_{\text{input}} + E_{\text{without capture}} - T_{\text{for storage}}$$

Where:

$E_{\text{capture installation}}$	= Total greenhouse gas emissions of the capture installation;
$T_{\text{input}}$	= Amount of CO <sub>2</sub> transferred to the capture installation, determined in accordance with Article 40 to 46 and Article 49.
$E_{\text{without capture}}$	= Emissions of the installation assuming the CO <sub>2</sub> were not captured, meaning the sum of the emissions from all other activities at the installation, monitored in accordance with relevant sections of Annex IV;
$T_{\text{for storage}}$	= Amount of CO <sub>2</sub> transferred to a transport network or a storage site, determined in accordance with Article 40 to 46 and Article 49.

In cases where CO<sub>2</sub> capture is carried out by the same installation as the one from which the captured CO<sub>2</sub> originates, the operator shall use zero for  $T_{\text{input}}$ .

In cases of stand-alone capture installations, the operator shall consider  $E_{\text{without capture}}$  to represent the amount of emissions that occur from other sources than the CO<sub>2</sub> transferred to the installation for capture. The operator shall determine those emissions in accordance with this Regulation.

In the case of stand-alone capture installations, the operator of the installation transferring CO<sub>2</sub> to the capture installation shall deduct the amount  $T_{\text{input}}$  from the emissions of its installation in accordance with Article 49.

### B.2. Determination of transferred CO<sub>2</sub>

Each operator shall determine the amount of CO<sub>2</sub> transferred from and to the capture installation in accordance with Article 49 by means of measurement methodologies carried out in accordance with Articles 40 to 46.

Only where the operator of the installation transferring CO<sub>2</sub> to the capture installation demonstrates to the satisfaction of the competent authority that CO<sub>2</sub> transferred to the capture installation is transferred in total and to at least equivalent accuracy, may the competent authority

allow that operator to use a calculation-based methodology in accordance with Article 24 or 25 to determine the amount  $T_{input}$  instead of a measurement-based methodology in accordance with Article 40 to 46 and Article 49.

## 22. **Determination of greenhouse gas emissions from the transport of CO<sub>2</sub> by pipelines for geological storage in a storage site permitted under Directive 2009/31/EC**

### A. *Scope*

The boundaries for monitoring and reporting emissions from CO<sub>2</sub> transport by pipeline shall be laid down in the transport network's greenhouse gas emissions permit, including all ancillary plant functionally connected to the transport network, including booster stations and heaters. Each transport network shall have a minimum of one start point and one end point, each connected to other installations carrying out one or more of the activities: capture, transport or geological storage of CO<sub>2</sub>. Start and end points may include bifurcations of the transport network and cross national borders. Start and end points as well as the installations they are connecting to, shall be laid down in the greenhouse gas emissions permit.

Each operator shall consider at least the following potential emission sources for CO<sub>2</sub> emissions: combustion and other processes at installations functionally connected to the transport network including booster stations; fugitive emissions from the transport network; vented emissions from the transport network; and emissions from leakage incidents in the transport network.

### B. *Quantification methodologies for CO<sub>2</sub>*

The operator of transport networks shall determine emissions using one of the following methods:

- (a) Method A (overall mass balance of all input and output streams) set out in subsection B.1;
- (b) Method B (monitoring of emission sources individually) set out in subsection B.2.

In choosing either Method A or Method B, each operator shall demonstrate to the competent authority that the chosen methodology will lead to more reliable results with lower uncertainty of the overall emissions, using best available technology and knowledge at the time of the application for the greenhouse gas emissions permit and approval of the monitoring plan, without incurring unreasonable costs. Where Method B is chosen each operator shall demonstrate to the satisfaction of the competent authority that the overall uncertainty for the annual level of greenhouse gas emissions for the operator's transport network does not exceed 7,5 %.

The operator of a transport network using Method B shall not add CO<sub>2</sub> received from another installation permitted in accordance with Directive 2003/87/EC to its calculated level of emissions, and shall not subtract from its calculated level of emissions any CO<sub>2</sub> transferred to another installation permitted in accordance with Directive 2003/87/EC.

Each operator of a transport network shall use Method A for the validation of the results of Method B at least once annually. For that validation, the operator may use lower tiers for the application of Method A.

#### B.1. Method A

Each operator shall determine emissions in accordance with the following formula:

$$\text{Emissions [tCO}_2\text{]} = E_{\text{own activity}} + \sum_i T_{IN, i} - \sum_j T_{OUT, j}$$

Where:

Emissions	= Total CO <sub>2</sub> emissions of the transport network [t CO <sub>2</sub> ];
E <sub>own activity</sub>	= Emissions from the transport network's own activity, meaning not emissions stemming from the CO <sub>2</sub> transported, but including emissions from fuel used in booster stations, monitored in accordance with the relevant sections of Annex IV;
T <sub>IN,i</sub>	= Amount of CO <sub>2</sub> transferred to the transport network at entry point <i>i</i> , determined in accordance with Articles 40 to 46 and Article 49.
T <sub>OUT,j</sub>	= Amount of CO <sub>2</sub> transferred out of the transport network at exit point <i>j</i> , determined in accordance with Articles 40 to 46 and Article 49.

## B.2. Method B

Each operator shall determine emissions considering all processes relevant to emissions at the installation as well as the amount of CO<sub>2</sub> captured and transferred to the transport facility using the following formula:

$$\text{Emissions [t CO}_2\text{]} = \text{CO}_2 \text{ fugitive} + \text{CO}_2 \text{ vented} + \text{CO}_2 \text{ leakage events} + \text{CO}_2 \text{ installations}$$

Where:

Emissions	= Total CO <sub>2</sub> emissions of the transport network [t CO <sub>2</sub> ];
CO <sub>2</sub> fugitive	= Amount of fugitive emissions [t CO <sub>2</sub> ] from CO <sub>2</sub> transported in the transport network, including from seals, valves, intermediate compressor stations and intermediate storage facilities;
CO <sub>2</sub> vented	= Amount of vented emissions [t CO <sub>2</sub> ] from CO <sub>2</sub> transported in the transport network;
CO <sub>2</sub> leakage events	= Amount of CO <sub>2</sub> [t CO <sub>2</sub> ] transported in the transport network, which is emitted as the result of the failure of one or more components of the transport network;
CO <sub>2</sub> installations	= Amount of CO <sub>2</sub> [t CO <sub>2</sub> ] being emitted from combustion or other processes functionally connected to the pipeline transport in the transport network, monitored in accordance with the relevant sections of Annex IV.

### B.2.1. Fugitive emissions from the transport network

The operator shall consider fugitive emissions from any of the following types of equipment:

- (a) seals;
- (b) measurement devices;
- (c) valves;
- (d) intermediate compressor stations;
- (e) intermediate storage facilities.

The operator shall determine average emission factors *EF* (expressed in g CO<sub>2</sub>/unit time) per piece of equipment per occurrence where fugitive emissions can be anticipated at the beginning of operation, and by the end of the first reporting year in which the transport network is in operation at the latest. The operator shall review those factors at least every 5 years in the light of the best available techniques and knowledge.

The operator shall calculate fugitive emissions by multiplying the number of pieces of equipment in each category by the emission factor and adding up the results for the single categories as shown in the following equation:

$$\text{Fugitive emissions [tCO}_2\text{]} = \left( \sum_{\text{Category}} \text{EF [gCO}_2\text{/ occurrence]} * \text{number of occurrences} \right) / 1\,000\,000$$

The number of occurrences shall be the number of pieces of the given equipment per category, multiplied by the number of time units per year.

#### B.2.2. Emissions from leakage events

The operator of a transport network shall provide evidence of the network integrity by using representative (spatial and time-related) temperature and pressure data. Where the data indicates that a leakage has occurred, the operator shall calculate the amount of CO<sub>2</sub> leaked with a suitable methodology documented in the monitoring plan, based on industry best practice guidelines, including by use of the differences in temperature and pressure data compared to integrity related average pressure and temperature values.

#### B.2.3. Vented emissions

Each operator shall provide in the monitoring plan an analysis regarding potential situations of venting emissions, including for maintenance or emergency reasons, and provide a suitable documented methodology for calculating the amount of CO<sub>2</sub> vented, based on industry best practice guidelines.

### 23. **Geological storage of CO<sub>2</sub> in a storage site permitted under Directive 2009/31/EC**

#### A. *Scope*

The competent authority shall base the boundaries for monitoring and reporting of emissions from geological storage of CO<sub>2</sub> on the delimitation of the storage site and storage complex as specified in the permit pursuant Directive 2009/31/EC. Where leakages from the storage complex are identified and lead to emissions or release of CO<sub>2</sub> into the water column, the operator shall immediately carry out all of the following:

- (a) notify the competent authority;
- (b) include the leakage as an emission source for the respective installation;
- (c) monitor and report the emissions.

Only when corrective measures in accordance with Article 16 of Directive 2009/31/EC have been taken and emissions or release into the water column from that leakage can no longer be detected shall the operator delete the respective leakage as emission source from the monitoring plan and no longer monitor and report those emissions.

Each operator of a geological storage activity shall consider at least the following potential emission sources for CO<sub>2</sub> overall: fuel use by associated booster stations and other combustion activities including on-site power plants; venting from injection or enhanced hydrocarbon recovery operations; fugitive emissions from injection; breakthrough CO<sub>2</sub> from enhanced hydrocarbon recovery operations; and leakages.

#### B. *Quantification of CO<sub>2</sub> emissions*

The operator of the geological storage activity shall not add CO<sub>2</sub> received from another installation to its calculated level of emissions, and shall not subtract from its calculated level

of emissions any CO<sub>2</sub> which is geologically stored in the storage site or which is transferred to another installation.

#### B.1. Vented and fugitive emissions from injection

The operator shall determine emissions from venting and fugitive emissions as follows:

$$\text{CO}_2 \text{ emitted [t CO}_2\text{]} = V \text{ CO}_2 \text{ [t CO}_2\text{]} + F \text{ CO}_2 \text{ [t CO}_2\text{]}$$

Where:

V CO<sub>2</sub> = amount of CO<sub>2</sub> vented;  
F CO<sub>2</sub> = amount of CO<sub>2</sub> from fugitive emissions.

Each operator shall determine V CO<sub>2</sub> using measurement-based methodologies in accordance with Articles 41 to 46 of this Regulation. By way of derogation from the first sentence and upon approval by the competent authority, the operator may include in the monitoring plan an appropriate methodology for determining V CO<sub>2</sub> based on industry best practice, where the application of measurement-based methodologies would incur unreasonable costs.

The operator shall consider F CO<sub>2</sub> as one source, meaning that the uncertainty requirements associated with the tiers in accordance with section 1 of Annex VIII are applied to the total value instead of the individual emission points. Each operator shall provide in the monitoring plan an analysis regarding potential sources of fugitive emissions, and provide a suitable documented methodology to calculate or measure the amount of F CO<sub>2</sub>, based on industry best practice guidelines. For the determination of F CO<sub>2</sub> the operator may use data collected in accordance with Article 32 to 35 and Annex II(1.1)(e) to (h) of Directive 2009/31/EC for the injection facility, where they comply with the requirements of this Regulation.

#### B.2. Vented and fugitive emissions from enhanced hydrocarbon recovery operations

Each operator shall consider the following potential additional emission sources from enhanced hydrocarbon recovery (EHR):

- (a) the oil-gas separation units and gas recycling plant, where fugitive emissions of CO<sub>2</sub> could occur;
- (b) the flare stack, where emissions might occur due to the application of continuous positive purge systems and during depressurisation of the hydrocarbon production installation;
- (c) the CO<sub>2</sub> purge system, to avoid high concentrations of CO<sub>2</sub> extinguishing the flare.

Each operator shall determine fugitive emissions or vented CO<sub>2</sub> in accordance with subsection B.1 of this section of Annex IV.

Each operator shall determine emissions from the flare stack in accordance with subsection D of section 1 of this Annex, taking into account potential inherent CO<sub>2</sub> in the flare gas in accordance with Article 48.

#### B.3. Leakage from the storage complex

Emissions and release to the water column shall be quantified as follows:

$$\text{CO}_2 \text{ emitted [t CO}_2\text{]} = \sum_{T_{\text{start}}}^{T_{\text{end}}} L \text{ CO}_2 \text{ [t CO}_2\text{/d]}$$

Where:

- $L_{CO_2}$  = the mass of CO<sub>2</sub> emitted or released per calendar day due to the leakage in accordance with all of the following:
- for each calendar day for which leakage is monitored, each operator shall calculate  $L_{CO_2}$  as the average of the mass leaked per hour [t CO<sub>2</sub>/h] multiplied by 24;
  - each operator shall determine the mass leaked per hour in accordance with the provisions in the approved monitoring plan for the storage site and the leakage;
  - for each calendar day prior to commencement of monitoring, the operator shall take the mass leaked per day to equal the mass leaked per day for the first day of monitoring ensuring no under-estimation occurs;
- $T_{start}$  = the latest of:
- the last date when no emissions or release of CO<sub>2</sub> into the water column from the source under consideration were reported;
  - the date the CO<sub>2</sub> injection started;
  - another date such that there is evidence demonstrating to the satisfaction of the competent authority that the emission or release into the water column cannot have started before that date.
- $T_{end}$  = the date by which corrective measures in accordance with Article 16 of Directive 2009/31/EC have been taken and emissions or release of CO<sub>2</sub> into the water column can no longer be detected.

The competent authority shall approve and allow the use of other methods for the quantification of emissions or release of CO<sub>2</sub> into the water column from leakages where the operator can show to the satisfaction of the competent authority that such methods lead to a higher accuracy than the methodology set out in this subsection.

The operator shall quantify the amount of emissions leaked from the storage complex for each of the leakage events with a maximum overall uncertainty over the reporting period of 7,5 %. Where the overall uncertainty of the applied quantification methodology exceeds 7,5 %, each operator shall apply an adjustment, as follows:

$$CO_{2,Reported} [t CO_2] = CO_{2,Quantified} [t CO_2] * (1 + (Uncertainty_{System} [\%]/100) - 0,075)$$

Where:

- $CO_{2,Reported}$  = the amount of CO<sub>2</sub> to be included in the annual emission report with regards to the leakage event in question;
- $CO_{2,Quantified}$  = the amount of CO<sub>2</sub> determined through the used quantification methodology for the leakage event in question;
- $Uncertainty_{System}$  = the level of uncertainty associated with the quantification methodology used for the leakage event in question.

a IPCC 2006 Guidelines for National Greenhouse Gas Inventories.

### 3. Global warming potentials for non-CO<sub>2</sub> greenhouse gases

Table 6:

#### GLOBAL WARMING POTENTIALS

Gas	Global warming potential
N <sub>2</sub> O	310 t CO <sub>2(e)</sub> /t N <sub>2</sub> O
CF <sub>4</sub>	6 500 t CO <sub>2(e)</sub> /t CF <sub>4</sub>
C <sub>2</sub> F <sub>6</sub>	9 200 t CO <sub>2(e)</sub> /t C <sub>2</sub> F <sub>6</sub>

#### ANNEX VII

#### MINIMUM FREQUENCY OF ANALYSES (ARTICLE 35)

Fuel/material	Minimum frequency of analyses
Natural gas	At least weekly
Process gas (refinery mixed gas, coke oven gas, blast-furnace gas and convertor gas)	At least daily — using appropriate procedures at different parts of the day
Fuel oil	Every 20 000 tonnes and at least six times a year
Coal, coking coal, petroleum coke	Every 20 000 tonnes and at least six times a year
Solid waste (pure fossil or mixed biomass fossil)	Every 5 000 tonnes and at least four times a year

*Status: This is the original version (as it was originally adopted).*

Liquid waste	Every 10 000 tonnes and at least four times a year
Carbonate minerals (including limestone and dolomite)	Every 50 000 tonnes and at least four times a year
Clays and shales	Amounts of material corresponding to 50 000 tonnes of CO <sub>2</sub> and at least four times a year
Other input and output streams in the mass balance (not applicable for fuels or reducing agents)	Every 20 000 tonnes and at least once every month
Other materials	Depending on the type of material and the variation, amounts of material corresponding to 50 000 tonnes of CO <sub>2</sub> and at least four times a year

## ANNEX VIII

### Measurement-based methodologies (Article 41)

#### 1. Tier definitions for measurement-based methodologies

Measurement-based methodologies shall be approved in accordance with tiers with the following maximum permissible uncertainties for the annual average hourly emissions calculated in accordance with Equation 2 set out in section 3 of this Annex.

TABLE 1

#### Tiers for CEMS (maximum permissible uncertainty for each tier)

	Tier 1	Tier 2	Tier 3	Tier 4
CO <sub>2</sub> emission sources	± 10 %	± 7,5 %	± 5 %	± 2,5 %
N <sub>2</sub> O emission sources	± 10 %	± 7,5 %	± 5 %	N.A.
CO <sub>2</sub> transfer	± 10 %	± 7,5 %	± 5 %	± 2,5 %

#### 2. Minimum requirements

TABLE 2

#### Minimum requirements for measurement-based methodologies

Greenhouse gas	Minimum tier level required		
	Category A	Category B	Category C
CO <sub>2</sub>	2	2	3
N <sub>2</sub> O	2	2	3

### 3. Determination of GHGs using measurement-based methodologies

Equation Calculation of Annual Emissions

1:

$$GHG_{tot\ ann} [t] = \sum_{i=1}^{operating\ hours\ p.a.} GHG\ conc_{hourly\ i} * flue\ gas\ flow_i * 10^{-6} [t/g]$$

Where:

GHG conc<sub>hourly</sub> = hourly concentrations of emissions in g/Nm<sup>3</sup> in the flue gas flow measured during operation;

Flue gas flow = flue gas flow in Nm<sup>3</sup> for each hour.

Equation Determination of average hourly concentrations

2:

$$GHG\ emissions_{av\ hourly} [kg/h] = \frac{\sum GHG\ concentration_{hourly} [g/Nm^3] * flue\ gas\ flow [Nm^3/h]}{Hours\ of\ operation * 1\ 000}$$

Where:

GHG emissions<sub>av</sub> = annual average hourly emissions in kg/h from the source;

GHG conc<sub>hourly</sub> = hourly concentrations of emissions in g/Nm<sup>3</sup> in the flue gas flow measured during operation;

Flue gas flow = flue gas flow in Nm<sup>3</sup> for each hour.

### 4. Calculation of the concentration using indirect concentration measurement

Equation Calculation of the concentration

3:

$$GHG\ concentration\ [%] = 100\ \% - \sum Concentration\ of\ component_i\ [%]$$

### 5. Substitution for missing concentration data for measurement-based methodologies

Equation Substitution for missing data for measurement-based methodologies

4:

$$C_{*}^{subst} = \bar{C} + 2\sigma_{C_{*}}$$

Where:

$\bar{C}$  = the arithmetic mean of the concentration of the specific parameter over the whole reporting period or, where specific circumstances applied when data loss occurred, an appropriate period reflecting the specific circumstances;

$\sigma_{C_{*}}$  = the best estimate of the standard deviation of the concentration of the specific parameter over the whole reporting or, where specific circumstances applied when data loss occurred, an appropriate period reflecting the specific circumstances.

## ANNEX IX

### **Minimum data and information to be retained in accordance with Article 66(1)**

Operators and aircraft operators shall retain at least the following:

1. **Common elements for installations and aircraft operators**
  - (1) The monitoring plan approved by the competent authority;
  - (2) Documents justifying the selection of the monitoring methodology and the documents justifying temporal or non-temporal changes of monitoring methodologies and tiers approved by the competent authority;
  - (3) All relevant updates of monitoring plans notified to the competent authority in accordance with Article 15, and the competent authority's replies;
  - (4) All written procedures referred to in the monitoring plan, including the sampling plan where relevant, the procedures for data flow activities and the procedures for control activities;
  - (5) A list of all versions used of the monitoring plan and all related procedures;
  - (6) Documentation of the responsibilities in connection to the monitoring and reporting;
  - (7) The risk assessment performed by the operator or aircraft operator, where applicable;
  - (8) The improvement reports in accordance with Article 69;
  - (9) The verified annual emission report;
  - (10) The verification report;
  - (11) Any other information that is identified as required for the verification of the annual emissions report.
2. **Specific elements for stationary source installations**
  - (1) The greenhouse gas emissions permit, and any updates thereof;
  - (2) Any uncertainty assessments, where applicable;
  - (3) For calculation-based methodologies applied in installations:
    - (a) the activity data used for any calculation of the emissions for each source stream, categorised according to process and fuel or material type;
    - (b) a list of all default values used as calculation factors, where applicable;
    - (c) the full set of sampling and analysis results for the determination of calculation factors;
    - (d) documentation about all ineffective procedures corrected and correction action taken in accordance with Article 63;
    - (e) any results of calibration and maintenance of measuring instruments;
  - (4) For measurement-based methodologies in installations, the following additional elements:

- (a) documentation justifying the selection of a measurement-based methodology;
  - (b) the data used for the uncertainty analysis of emissions from each emission source, categorised according to process;
  - (c) the data used for the corroborating calculations and results of the calculations;
  - (d) a detailed technical description of the continuous measurement system including the documentation of the approval from the competent authority;
  - (e) raw and aggregated data from the continuous measurement system, including documentation of changes over time, the log-book on tests, down-times, calibrations, servicing and maintenance;
  - (f) documentation of any changes to the continuous measurement system;
  - (g) any results of the calibration and maintenance of measuring instruments;
  - (h) where applicable, the mass or energy balance model used for the purpose of determining surrogate data in accordance with Article 45(4) and underlying assumptions;
- (5) Where a fall-back methodology as referred to in Article 22 is applied, all data necessary for determining the emissions for the emission sources and source streams for which that methodology is applied, as well as proxy data for activity data, calculation factors and other parameters which would be reported under a tier methodology;
- (6) For primary aluminium production, the following additional elements:
- (a) documentation of results from measurement campaigns for the determination of the installation specific emission factors for CF<sub>4</sub> and C<sub>2</sub>F<sub>6</sub>;
  - (b) documentation of the results of the determination of the collection efficiency for fugitive emissions;
  - (c) all relevant data on primary aluminium production, anode effect frequency and duration or overvoltage data;
- (7) For CO<sub>2</sub> capture, transport and geological storage activities, where applicable, the following additional elements:
- (a) documentation of the amount of CO<sub>2</sub> injected into the storage complex by installations carrying out geological storage of CO<sub>2</sub>;
  - (b) representatively aggregated pressure and temperature data from a transport network;
  - (c) a copy of the storage permit, including the approved monitoring plan, pursuant to Article 9 of Directive 2009/31/EC;
  - (d) the reports submitted in accordance with Article 14 of Directive 2009/31/EC;
  - (e) reports on the results of the inspections carried out in accordance with Article 15 of Directive 2009/31/EC;

- (f) documentation on corrective measures taken in accordance with Article 16 of Directive 2009/31/EC.

### 3. **Specific elements for aviation activities**

- (1) A list of aircraft owned, leased-in and leased-out, and necessary evidence for the completeness of that list; for each aircraft the date when it is added to or removed from the aircraft operator's fleet;
- (2) A list of flights covered in each reporting period, and necessary evidence for the completeness of that list;
- (3) Relevant data used for determining the fuel consumption and emissions;
- (4) Data used for determining the payload and distance relevant for the years for which tonne-kilometre data are reported;
- (5) Documentation on the methodology for data gaps where applicable, and the data used for closing the data gaps where they have occurred.

## ANNEX X

### **Minimum content of Annual Reports (Article 67(3))**

#### 1. **Annual emission reports of stationary source installations**

The annual emission report of an installation shall at least contain the following information:

- (1) Data identifying the installation, as specified in Annex IV to Directive 2003/87/EC, and its unique permit number;
- (2) Name and address of the verifier of the report;
- (3) The reporting year;
- (4) Reference to and version number of the relevant approved monitoring plan;
- (5) Relevant changes in the operations of an installation and changes as well as temporary deviations that occurred during the reporting period to the monitoring plan approved by the competent authority; including temporal or permanent changes of tiers, reasons for those changes, starting date for the changes, and starting and ending dates of temporal changes;
- (6) Information for all emissions sources and source streams consisting of at least:
  - (a) the total emissions expressed as t CO<sub>2(e)</sub>;
  - (b) where greenhouse gases other than CO<sub>2</sub> are emitted, the total emissions expressed as t;
  - (c) whether the measurement or the calculation methodology referred to in Article 21 is applied;
  - (d) the tiers applied;
  - (e) activity data:

- (i) in the case of fuels the amount of fuel (expressed as tonnes or Nm<sup>3</sup>) and the net calorific value (GJ/t or GJ/Nm<sup>3</sup>) reported separately;
    - (ii) for all other source streams the amount expressed as tonnes or Nm<sup>3</sup>;
  - (f) emission factors, expressed in accordance with the requirements set out in Article 36(2); biomass fraction, oxidation and conversion factors, expressed as dimensionless fractions;
  - (g) where emission factors for fuels are related to mass instead of energy, proxy data for the net calorific value of the respective source stream;
- (7) Where a mass balance methodology is applied, the mass flow, and carbon content for each source stream into and out of the installation; biomass fraction and net calorific value, where relevant;
- (8) Information to be reported as memo items, consisting of at least:
  - (a) amounts of biomass combusted, expressed in TJ, or employed in processes, expressed in t or Nm<sup>3</sup>;
  - (b) CO<sub>2</sub> emissions from biomass, expressed in t CO<sub>2</sub>, where measurement-based methodology is used to determine emissions;
  - (c) a proxy for the net calorific value of the biomass source streams used as fuel, where relevant;
  - (d) amounts and energy content of bioliquids and biofuels combusted, expressed in t and TJ;
  - (e) CO<sub>2</sub> transferred to an installation or received from an installation, where Article 49 is applicable, expressed in t CO<sub>2</sub>;
  - (f) inherent CO<sub>2</sub> transferred to an installation or received from an installation, where Article 48 is applicable, expressed in t CO<sub>2</sub>;
  - (g) where applicable, the name of the installation and its identification code as recognised in accordance with Regulation (EU) No 1193/2011:
    - (i) of the installation(s) to which CO<sub>2</sub> is transferred in accordance with points (e) and (f) of this point (8);
    - (ii) of the installation(s) from which CO<sub>2</sub> is received in accordance with points (e) and (f) of this point (8);
  - (h) transferred CO<sub>2</sub> from biomass, expressed in t CO<sub>2</sub>;
- (9) Where a measurement methodology is applied:
  - (a) where CO<sub>2</sub> is measured as the annual fossil CO<sub>2</sub>-emissions and the annual CO<sub>2</sub>-emissions from biomass use;
  - (b) the measured greenhouse gas concentrations and the flue gas flow expressed as an annual hourly average, and as an annual total value;
- (10) Where a methodology referred to in Article 22 is applied, all data necessary for determining the emissions for the emission sources and source streams for which that

- methodology is applied, as well as proxy data for activity data, calculation factors and other parameters which would be reported under a tier methodology;
- (11) Where data gaps have occurred and have been closed by surrogate data in accordance with Article 65(1):
- (a) the source stream or emission source to which each data gap applies;
  - (b) the reasons for each data gap;
  - (c) the starting and ending date and time of each data gap;
  - (d) the emissions calculated based on surrogate data;
  - (e) where the estimation method for surrogate data has not yet been included in the monitoring plan, a detailed description of the estimation method including evidence that the methodology used does not lead to an underestimation of emissions for the respective time period;
- (12) Any other changes in the installation during the reporting period with relevance for that installation's greenhouse gas emissions during the reporting year;
- (13) Where applicable, the production level of primary aluminium, the frequency and average duration of anode effects during the reporting period, or the anode effect overvoltage data during the reporting period, as well as the results of the most recent determination of the installation-specific emission factors for CF<sub>4</sub> and C<sub>2</sub>F<sub>6</sub> as outlined in Annex IV, and of the most recent determination of the collection efficiency of the ducts;
- (14) Waste types used within the installation and emissions resulting from their use as fuels or input materials shall be reported using the classification of the Community list of wastes specified in Commission Decision 2000/532/EC of 3 May 2000 replacing Decision 94/3/EC establishing a list of wastes pursuant to Article 1(a) of Council Directive 75/442/EEC on waste and Council Decision 94/904/EC establishing a list of hazardous waste pursuant to Article 1(4) of Council Directive 91/689/EEC on hazardous waste<sup>(9)</sup>. For those purposes the respective six digit codes shall be added to the names of the relevant waste types used in the installation.

Emissions occurring from different emission sources, or source streams of the same type of a single installation belonging to the same type of activity may be reported in an aggregate manner for the type of activity.

Where tiers have been changed within a reporting period, the operator shall calculate and report emission as separate sections of the annual report for the respective parts of the reporting period.

Operators of CO<sub>2</sub> storage sites may use simplified emission reports after closure of the storage site in accordance with Article 17 of Directive 2009/31/EC containing at least the elements listed under points 1 to 5, provided the greenhouse gas emissions permit contains no emission sources.

## 2. Annual emission reports of aircraft operators

The emission report for an aircraft operator shall at least contain the following information:

- (1) Data identifying the aircraft operator as set out by Annex IV to Directive 2003/87/EC, and the call sign or other unique designators used for air traffic control purposes, as well as relevant contact details;
- (2) Name and address of the verifier of the report;

- (3) The reporting year;
- (4) Reference to and version number of the relevant approved monitoring plan;
- (5) Relevant changes in the operations and deviations from the approved monitoring plan during the reporting period;
- (6) The aircraft registration numbers and types of aircraft used in the period covered by the report to perform the aviation activities covered by Annex I to Directive 2003/87/EC carried out by the aircraft operator;
- (7) The total number of flights covered by the report;
- (8) Total CO<sub>2</sub> emissions in tonnes of CO<sub>2</sub> disaggregated by the Member State of departure and arrival;
- (9) Where emissions are calculated using an emission factor or carbon content related to mass or volume, proxy data for the net calorific value of the fuel;
- (10) Where data gaps have occurred and have been closed by surrogate data in accordance with Article 65(2):
  - (a) the circumstances and reasons for data gaps that apply;
  - (b) the estimation method for surrogate data applied;
  - (c) the emissions calculated based on surrogate data;
- (11) Memo-items:
  - (a) amount of biomass used as fuel during the reporting year (in tonnes or m<sup>3</sup>) listed per fuel type;
  - (b) the net calorific value of alternative fuels;
- (12) As an annex to the annual emission report, the operator shall include annual emissions and annual numbers of flights per aerodrome pair. Upon request of the operator the competent authority shall treat that information as confidential.

### 3. **Tonne-kilometre data reports of aircraft operators**

The tonne-kilometre data report for an aircraft operator shall at least contain the following information:

- (1) Data identifying the aircraft operator as set out by Annex IV to Directive 2003/87/EC, and the call sign or other unique designator used for air traffic control purposes, as well as relevant contact details;
- (2) Name and address of the verifier of the report;
- (3) The reporting year;
- (4) Reference to and version number of the relevant approved monitoring plan;
- (5) Relevant changes in the operations and deviations from the approved monitoring plan during the reporting period;
- (6) The aircraft registration numbers and types of aircraft used in the period covered by the report to perform the aviation activities covered by Annex I to Directive 2003/87/EC carried out by the aircraft operator;

---

*Status: This is the original version (as it was originally adopted).*

---

- (7) Chosen method for calculating the mass of passengers and checked baggage, as well as freight and mail;
- (8) Total number of passenger-kilometres and tonne-kilometres for all flights performed during the year to which the report relates falling within the aviation activities listed in Annex I to Directive 2003/87/EC;
- (9) For each aerodrome pair, the: ICAO designator of the two aerodromes; distance (great circle distance + 95 km) in km; total number of flights per aerodrome pair in the reporting period; total mass of passengers and checked baggage (tonnes) during the reporting period per aerodrome pair; total number of passengers during the reporting period; total number of passenger multiplied by kilometres per aerodrome pair; total mass of freight and mail (tonnes) during the reporting period per aerodrome pair; total tonne-kilometres per aerodrome pair (t km).
