### **COMMISSION IMPLEMENTING REGULATION (EU) 2017/2470**

#### of 20 December 2017

### establishing the Union list of novel foods in accordance with Regulation (EU) 2015/2283 of the European Parliament and of the Council on novel foods

#### (Text with EEA relevance)

## Article 1

## Union list of authorised novel foods

The Union list of novel foods authorised to be placed on the market within the Union as referred to in Article 6(1) of Regulation (EU) 2015/2283 is hereby established and set out in the Annex to this Regulation.

## Article 2

This Regulation shall enter into force on the twentieth day following that of its publication in the *Official Journal of the European Union*.

This Regulation shall be binding in its entirety and directly applicable in all Member States.

## ▼<u>B</u>

ANNEX

### UNION LIST OF NOVEL FOODS

#### Content of the list

- 1. The Union list shall consist of Tables 1 and 2.
- 2. Table 1 includes the authorised novel foods and contains the following information:

Column 1: Authorised novel food

- Column 2: Conditions under which the novel food may be used. This column is further subdivided into two: Specified food category and Maximum levels
- Column 3: Additional specific labelling requirements

Column 4: Other requirements

3. Table 2 includes the specifications on novel foods and contains the following information:

Column 1: Authorised novel food

Column 2: Specifications

## Table 1: Authorised novel foods

| Authorised novel food                   | Conditions under which the nove  | l food may be used  | Additional specific labelling requirements  | Other require-<br>ments | ► <u>M13</u> Data Protection ◄ |
|---|--|---|---|-------------------------|--------------------------------|
| <i>N</i> -Acetyl-D-neur-<br>aminic acid | Specified food category  | Maximum levels  | The designation of the novel food on the labelling of the foodstuffs containing it shall be ' <i>N</i> -acetyl-D-neuraminic acid'   |                         |                                |
|   | Infant and follow-on formulae as defined by Regulation (EU) No 609/2013 ( <sup>1</sup> )   | 0,05 g/L of reconstituted formula   | Food supplements containing <i>N</i> -acetyl-<br>D-neuraminic acid shall bear a statement that the food supplement  |                         |                                |
|   | Processed cereal-based foods and baby foods<br>for infants and young children as defined by<br>Regulation (EU) No 609/2013   | 0,05 g/kg for solid foods   | should not be given to infants, young<br>children and children under 10 years of<br>age where they consume breast milk or<br>other foods with added <i>N</i> -acetyl-D-neur-<br>aminic acid within the same twenty four<br>hour period. |                         |                                |
|   | Foods for special medical purposes for<br>infants and young children as defined by<br>Regulation (EU) No 609/2013  | In accordance with the particular<br>nutritional requirements of the<br>infants and young children for<br>whom the products are intended<br>but in any case not higher than<br>the maximum levels specified for<br>the category mentioned in the<br>table corresponding to the prod-<br>ucts. |   |                         |                                |
|   | Total diet replacement foods for weight<br>control as defined by Regulation (EU) No<br>609/2013  | 0,2 g/L (drinks)<br>1,7 g/kg (bars)   |   |                         |                                |
|   | Foods bearing statements on the absence or<br>reduced presence of gluten in accordance<br>with the requirements of Commission Imple-<br>menting Regulation (EU) No 828/2014 ( <sup>2</sup> ) | 1,25 g/kg   |   |                         |                                |
|   | Unflavoured pasteurised and sterilised<br>(including UHT) milk-based products  | 0,05 g/L  |   |                         |                                |

| Authorised novel food                                     | Conditions under which the nove   | el food may be used   | Additional specific labelling requirements  | Other require-<br>ments | ► <u>M13</u> Data Protection ◄ |
|---|---|---|---|-------------------------|--------------------------------|
|   | Unflavoured fermented milk-based products,<br>heat treated after fermentation, flavoured<br>fermented milk products including heat-<br>treated products                               | 0,05 g/L (beverages)<br>0,4 g/kg (solids)   |   |                         |                                |

| Astaxanthin-rich oleoresin                   | Description/Definition:   |
| from <i>Haematococcus pluvialis</i><br>algae | Astaxanthin is a carotenoid produced by <i>Haematococcus pluvialis</i> algae. Production methods for the growth of the algae are variable; using either closed systems exposed to sunlight or strictly controlled illuminated light; alternatively open ponds may be used. The algal cells are harvested and dried; the oleoresin is extracted using either super critical CO <sub>2</sub> or a solvent (ethyl acetate). The Astaxanthin is diluted and standardized to 2,5 %, 5,0 %, 7,0 %, 10 % 15 % or 20 % using olive oil, safflower oil, Sunflower oil or MCT (Medium Chain Triglycerides). |

| ovine lactoferrin                    | Description/Definition:   |
|                                      | Bovine lactoferrin is a protein that occurs naturally in cows' milk. It is an iron-binding glycoprotein of approximately 77 kDa and consists of a single polypeptide chain of 689 amino acids.  |
|                                      | Production process: Bovine lactoferrin is isolated from skimmed milk or cheese whey via ion exchange and subsequent ultra-filtration steps. Finally, it i dried by freeze drying or spraying and the large particles are sieved out. It is a virtually odourless, light pinkish powder. |

| α-cyclodextrin        | Description/Definition:  |
|                       | A non-reducing cyclic saccharide consisting of six $\alpha$ -1,4-linked D-glucopyranosyl units produced by the action of cyclodextrin glucosyltransfera (CGTase, EC 2.4.1.19) on hydrolyzed starch. Recovery and purification of $\alpha$ -cyclodextrin may be carried out using one of the following procedure precipitation of a complex of $\alpha$ -cyclodextrin with 1-decanol, dissolution in water at elevated temperature and re-precipitation, steam-stripping of the complexant, and crystallisation of $\alpha$ -cyclodextrin from the solution; or chromatography with ion-exchange or gel filtration followed by crystallisation of cyclodextrin from the purified mother liquor; or membrane separation methods such as ultra-filtration and reverse osmosis: Description: Virtually odourles white or almost white crystalline solid. |
|                       | Synonyms: α-cyclodextrin, α-dextrin, cyclohexaamylose, cyclomaltohexaose, α-cycloamylase   |
|                       | Chemical name: Cyclohexaamylose  |
|                       | CAS No.: 10016-20-3  |
|                       | Chemical formula: (C <sub>6</sub> H <sub>10</sub> O <sub>5</sub> ) <sub>6</sub>  |
|                       | Formula weight: 972,85   |
|                       | Assay: $\geq$ 98 % (dry basis)   |
|                       | Identification:  |
|                       | Melting range: Decomposes above 278 °C   |
|                       | Solubility: Freely soluble in water; very slightly soluble in ethanol  |
|                       | Specific rotation: $[\alpha]_D^{25}$ : Between +145° and +151° (1% solution)   |
|                       | Chromatography: The retention time for the major peak in a liquid chromatogram of the sample corresponds to that for $\alpha$ -cyclodextrin in a chromatogram of reference $\alpha$ -cyclodextrin (available from <i>Consortium für Elektrochemische Industrie GmbH, München, Germany or Wacker Biochem Group, Adrian, M</i> USA) using the conditions described in the METHOD OF ASSAY  |
|                       | Purity:  |
|                       | Water: $\leq 11$ % (Karl Fischer Method)   |
|                       | Residual complexant: $\leq 20 \text{ mg/kg}$   |
|                       | (1-decanol)  |
|                       | Reducing substances: $\leq 0.5$ % (as glucose)   |
|                       | Sulphated ash: $\leq 0,1 \%$   |
|                       | Lead: $\leq 0.5 \text{ mg/kg}$   |
|                       | Method of assay:   |
|                       | Determine by liquid chromatography using the following conditions:   |
|                       | Sample solution: Weigh accurately about 100 mg of test sample into a 10 ml volumetric flask and add 8 ml of deionised water. Dissolve the sam completely using an ultra-sonification bath (10-15 min) and dilute to the mark with purified deionised water. Filter through a 0,45-micrometer fil   |

|-----------------------|--|--|
|                       | Reference solution: Weigh accurately about 100 mg of $\alpha$ -cyclodextrin into a 10 ml volumetric flask and add 8 ml of deionised water. Dissolve the sample completely using an ultra-sonification bath and dilute to the mark with purified deionised water.   |  |
|                       | Chromatography: Liquid chromatograph equipped with a refractive index detector and an integrating recorder.  |  |
|                       | Column and packing: Nucleosil-100-NH2 (10 µm) (Macherey & Nagel Co. Düren, Germany) or similar   |  |
|                       | Length: 250 mm   |  |
|                       | Diameter: 4 mm   |  |
|                       | Temperature: 40 °C   |  |
|                       | Mobile phase: acetonitrile/water (67/33, v/v)  |  |
|                       | Flow rate: 2,0 ml/min  |  |
|                       | Injection volume: 10 $\mu$ lProcedure: Inject the sample solution into the chromatograph, record the chromatogram, and measure the area of the $\alpha$ -CD peak Calculate the percentage of $\alpha$ -cyclodextrin in the test sample as follows:   |  |
|                       | % $\alpha$ -cyclodextrin (dry basis) = 100 × (A <sub>S</sub> /A <sub>R</sub> ) (W <sub>R</sub> /W <sub>S</sub> )   |  |
|                       | where  |  |
|                       | As and AR are the areas of the peaks due to a-cyclodextrin for the sample solution and reference solution, respectively.   |  |
|                       | W <sub>S</sub> and W <sub>R</sub> are the weights (mg) of the test sample and reference α-cyclodextrin, respectively, after correcting for water content.  |  |
|                       |  |  |
|                       |  |  |
| -cyclodextrin         | Description/Definition:  |  |
|                       | A non-reducing cyclic saccharide consisting of eight $\alpha$ -1,4-linked D-glucopyranosyl units produced by the action of cyclodextrin glucosyltransferas (CGTase, EC 2.4.1.19) on hydrolysed starch. Recovery and purification of $\gamma$ -cyclodextrin may be carried out by precipitation of a complex of $\gamma$ -cyclodextrin with 8-cyclohexadecen-1-one, dissolution of the complex with water and n-decane, steam-stripping of the aqueous phase and recovery of gamma CD from the solution by crystallisation. |  |
|                       | Virtually odourless, white or almost white crystalline solid   |  |
|                       | Synonyms: γ-cyclodextrin, γ-dextrin, cyclooctaamylose, cyclomaltooctaose, γ-cycloamylase   |  |
|                       | Chemical name: Cyclooctaamylose  |  |
|                       | CAS number: 17465-86-0   |  |

| Ice Structuring Protein type<br>III HPLC 12               | <b>Description/Definition:</b><br>The Ice Structuring Protein (ISP) preparation is a light-brown liquid produced by submerged fermentation of a genetically-modified strain of food-graded baker's yeast ( <i>Saccharomyces cerevisiae</i> ) in which a synthetic gene for the ISP has been inserted into the yeast's genome. The protein is expressed and secreted into the growth medium where it is separated from the yeast cells by micro-filtration and concentrated by ultra-filtration. As a result, the yeast cells are not transferred into the ISP preparation as such or under an altered form. The ISP preparation consists of native ISP, glycosylated ISP and proteins and peptides from the yeast and sugars as well as acids and salts commonly found in food. The concentrate is stabilised with 10 mM citric acid buffer Assay: $\geq 5$ g/l active ISP pH: 2,5-3,5<br>Ash: $\leq 2,0$ %<br>DNA: Not detectable |

| Lucerne leaf extract from<br><i>Medicago sativa</i> | The Lucerne ( <i>Medicago sativa</i> L.) is processed within 2 hours after harvest. It is chopped and crushed. By passing through an oleaginous-type press, the   |  |
|   | Lucerne <i>(Mealcago saliva L.)</i> is processed within 2 nours after narvest. It is chopped and crushed. By passing through an oleaginous-type press, in Lucerne provides a fibrous residue and press juice (10 % of dry matter). The dry matter of this juice contains about 35 % of crude protein. The press juice (pH 5,8-6,2) is neutralised. Preheating and vapour injection allows coagulation of proteins associated with carotenoid and chlorophyll pigments. The protei precipitate is separated by centrifugation and thereafter dried. After adding ascorbic acid the Lucerne protein concentrate is granulated and stored in inergas or in cold storage. |  |

| Magnolia Bark Extract | Description/Definition:  |  |  |
|                       | Magnolia bark extract is obtained from the bark of the plant <i>Magnolia officinalis</i> L. and produced with supercritical carbon dioxide. The bark is washed and oven dried to reduce moisture content before being crushed and extracted with supercritical carbon dioxide. The extract is dissolved in medical-grade ethanol and re-crystallised to yield magnolia bark extract. |  |  |
|                       | Magnolia bark extract is mainly composed of two phenolic compounds, magnolol and honokiol.   |  |  |
|                       | Appearance: Light brownish powder  |  |  |

| Noni fruit juice ( <i>Morinda citrifolia</i> )                                | <b>Description/Definition:</b><br>Noni fruits (fruits of <i>Morinda citrifolia</i> L.) are pressed. The obtained juice is pasteurised. An optional fermentation step before or after the pressing may occur.<br>Rubiadin: $\leq 10 \ \mu$ g/kg<br>Lucidin: $\leq 10 \ \mu$ g/kg  |  |
| Noni fruit juice powder<br>( <i>Morinda citrifolia</i> )                      | <b>Description/Definition:</b><br>Seeds and skin of the sun-dried fruits of <i>Morinda citrifolia</i> are separated. The obtained pulp is filtered to separate juice from the flesh. Desiccation of the produced juice occurs in one or two ways:<br>Either by atomisation using maize maltodextrins, this mixture is obtained by keeping the rates of inflow of the juice and maltodextrins constant<br>Or by zeodratation or drying and then mixing with an excipient, this process allows the juice to be dried initially and then mixed with maltodextrins (same amount as used in atomisation). |  |
| Noni fruit puree and<br>concentrate ( <i>Morinda citri-</i><br><i>folia</i> ) | <b>Description/Definition:</b><br>The fruits of <i>Morinda citrifolia</i> are harvested by hand. Seeds and skin may be separated mechanically from the pureed fruits. After pasteurisation, the puree is packaged in aseptic containers and stored under cold conditions.  |  |

| Authorised Novel Food | Specifications  |
|-----------------------|---|
|                       | <i>Morinda citrifolia</i> concentrate is prepared from <i>M. citrifolia</i> puree by treatment with pectinolytic enzymes (50– 60 °C for 1-2 h). Then the puree is heated to inactivate the pectinases and then immediately cooled. The juice is separated in a decanter centrifuge. Afterwards the juice is collected and pasteurised, prior to being concentrated in a vacuum evaporator from a brix of 6 to 8 to a brix of 49 to 51 in the final concentrate. |
|                       | Composition:  |

| otein extract from pig | Description/Definition:   |  |
| lneys                  | The protein extract is obtained from homogenised pig kidneys through a combination of salt precipitation and high speed centrifugation. The obtain precipitate contains essentially proteins with 7 % of the enzyme diamine oxidase (enzyme nomenclature E.C. 1.4.3.22) and is resuspended in a physiolog buffer system. The obtained pig kidney extract is formulated as encapsulated enteric coated pellets to reach the active sites of digestion. |  |
|                        | Basic Product:  |  |
|                        | Specification: pig kidney protein excerpt with natural content of Diamin oxidase (DAO):   |  |
|                        | Physical condition: liquid  |  |
|                        | Colour: brownish  |  |
|                        | Appearance: slightly turbid solution  |  |
|                        | pH value: 6,4-6,8   |  |

| Fermented soybean extract           | Description/Definition:         Fermented soybean extract is an odourless milk-white coloured powder. It is comprised of 30 % fermented soybean extract powder and 70 % resistan dextrin (as carrier) from corn-starch, which is added during the processing. Vitamin $K_2$ is removed during the manufacturing process.         Fermented soybean extract contains nattokinase isolated from natto, a foodstuff produced by the fermentation of non-genetically modified soybeans ( $Glycine max$ (L.)) with a selected strain of <i>Bacillus subtilis</i> var. natto.         Nattokinase activity: 20 000 -28 000 Fibrin degradation unit/g( <sup>1</sup> )         Identity: Confirmable         Condition: No offensive taste or smell         Loss on drying: $\leq 10 \%$ Vitamin $K_2: \leq 0,1 mg/kg$ Heavy metals:         Lead: $\leq 5,0 mg/kg$ Arsenic: $\leq 3,0 mg/kg$ Microbiological criteria:         Total viable aerobic count: $\leq 10^3$ CFU( <sup>3</sup> /g |

| ucromalt                  | Description/Definition:  |  |
|                           | Sucromalt is a complex mixture of saccharides which is produced from sucrose and a starch hydrolysate by means of an enzymatic reaction. In this process, glucose units are attached to saccharides from the starch hydrolysate by means of an enzyme produced by the bacterium <i>Leuconostoc citreum</i> or by means of a recombinant strain of the production organism <i>Bacillus licheniformis</i> . The resulting oligosaccharides are characterised by the presence of $\alpha$ -(1 $\rightarrow$ 6) and $\alpha$ -(1 $\rightarrow$ 3) glycosidic compounds. The overall product is syrup, in addition to these oligosaccharides, contains mainly fructose but also the disaccharides leucrose and other disaccharides. Total solids: 75-80 % |  |

|   | $W_S$ = weight in mg of trehalose in the standard preparation  |
|   | $W_U$ = weight of dry sample in mg   |
|   | Characteristics:   |
|   | Identification:  |
|   | Solubility: Freely soluble in water, very slightly soluble in ethanol  |
|   | Specific rotation: $[\alpha]_D^{20} = +179^\circ$ (5 % aqueous solution, dihydrate), +199° (5 % aqueous solution, anhydrous substance) |
|   | Melting point: 97 °C (dihydrate)   |
|   | Purity:  |
|   | Loss on drying: $\leq 1,5 \%$ (60 °C, 5h)  |
|   | Total ash: $\leq 0.05$ %   |
|   | Heavy metals:  |
|   | Lead: $\leq 1,0 \text{ mg/kg}$   |
| UV treated mushrooms<br>(Agaricus bisporus) | Description/Definition:  |
|   | Commercially grown Agaricus bisporus to which UV light treatment is applied to harvested mushrooms.                                    |
|   | UV radiation: a process of radiation in ultraviolet light within the wavelength of 200-800 nm.   |
|   | Vitamin D <sub>2</sub> :   |
|   | Chemical name: (3β,5Z,7E,22E)-9,10-secoergosta-5,7,10(19),22-tetraen-3-ol  |
|   | Synonym: Ergocalciferol  |
|   | CAS No: 50-14-6  |
|   | Molecular weight: 396,65 g/mol   |
|   | Contents:  |
|   | Vitamin D <sub>2</sub> in the final product: 5-10 µg/100 g fresh weight at the expiration of shelf life                                |

| UV-treated baker's yeast  | Description/Definition:   |
| Saccharomyces cerevisiae) | Baker's yeast ( <i>Saccharomyces cerevisiae</i> ) is treated with ultraviolet light to induce the conversion of ergosterol to vitamin $D_2$ (ergocalciferol). Vitamin $D_2$ content in the yeast concentrate varies between 1 800 000-3 500 000 IU vitamin D/100 g (450-875 $\mu$ g/g). |
|                           | Tan-coloured, free-flowing granules   |
|                           | Vitamin D <sub>2</sub> :  |
|                           | Chemical name: (5Z,7E,22E)-3S-9,10-secoergosta-5,7,10(19),22-tetraen-3-ol   |
|                           | Synonym: Ergocalciferol   |
|                           | CAS No.: 50-14-6  |
|                           | Molecular weight: 396,65 g/mol  |
|                           | Microbiological criteria for the yeast concentrate:   |
|                           | Coliforms: $\leq 10^3/g$  |
|                           | Escherichia coli: $\leq 10/g$   |
|                           | Salmonella: Absence in 25g  |
| UV-treated bread          | Description/Definition:   |
|                           | UV-treated bread is yeast leavened bread and rolls (without toppings) to which a treatment with ultraviolet radiation is applied after baking in order to convert ergosterol to vitamin $D_2$ (ergocalciferol).   |
|                           | UV radiation: A process of radiation in ultraviolet light within the wavelength of 240-315 nm for maximum of 5 seconds with energy input of 10-50 mJ cm <sup>2</sup> .  |
|                           | Vitamin D <sub>2</sub> :  |
|                           | Chemical name: (5Z,7E,22E)-3S-9,10-secoergosta-5,7,10(19),22-tetraen-3-ol   |
|                           | Synonym: Ergocalciferol   |
|                           | CAS No: 50-14-6   |
|                           | Molecular weight: 396,65 g/mol  |
|                           | Contents:   |
|                           | Vitamin D <sub>2</sub> (ergocalciferol) in the final product: 0,75-3 $\mu$ g/100 g( <sup>1</sup> )  |
|                           | Yeast in dough: 1-5 g/100 g ( <sup>2</sup> )  |
|                           |   |

| JV-treated milk                      | Description/Definition:  |
|                                      | UV-treated milk is cow's milk (whole and semi-skimmed) to which a treatment with ultraviolet (UV) radiation via turbulent flow is applied after pasteurisation. The treatment of the pasteurised milk with UV radiation results in an increase in the vitamin $D_3$ (cholecalciferol) concentrations by conversion of 7-dehydrocholesterol to vitamin $D_3$ .          |
|                                      | UV radiation: A process of radiation in ultraviolet light within the wavelength of 200-310 nm with energy input of 1 045 J/l.  |
|                                      | Vitamin D <sub>3</sub> :   |
|                                      | Chemical name: (1S,3Z)-3-[(2E)-2-[(1R,3aS,7aR)-7a-methyl-1-[(2R)-6-methylheptan-2-yl]-2,3,3a,5,6,7-hexahydro-1H-inden-4-ylidene]ethylidene]-4-methyl idenecyclohexan-1-ol  |
|                                      | Synonym: Cholecalciferol   |
|                                      | CAS No: 67-97-0  |

| /itamin K <sub>2</sub> (menaquinone) | This novel food is produced by a synthetic or microbiological process.   |
|                                      | Vitamin $K_2$ (2-methyl-3-all-trans-polyprenyl-1,4-naphthoquinones), or the menaquinone series, is a group of prenylated naphthoquinone derivatives. The number of isoprene residues, where 1 isoprene unit consists of 5 carbons comprising the side chain, is used to characterise the menaquinone homologue containing primarily MK-7 and to a smaller extent MK-6. |
|                                      | Vitamin K <sub>2</sub> (menaquinones) series with menaquinone-7 (MK-7)(n = 6) being C <sub>46</sub> H <sub>64</sub> O <sub>2</sub> , menaquinone-6 (MK-6)(n = 5) being C <sub>41</sub> H <sub>56</sub> O <sub>2</sub> and menaquinone-4 (MK-4)(n = 3) being C <sub>31</sub> H <sub>40</sub> O <sub>2</sub> .   |
|                                      | Chemical Name: (all-E)-2-(3,7,11,15,19,23,27-Heptamethyl-2,6,10,14,18,22,26-octacosaheptaenyl)-3-methyl-1,4-naphtalenedione  |
|                                      | CAS Number: 2124-57-4  |
|                                      | Molecular formula: C <sub>46</sub> H <sub>64</sub> O <sub>2</sub>  |

| Yeast beta-glucans    | Description/Definition:  |
| least beta-glucans    | Beta-glucans are complex, high molecular mass (100–200 kDa) polysaccharides, found in the cell wall of many yeasts and cereals.  |
|                       | The chemical name for 'yeast beta-glucans' is (1-3),(1-6)-B-D-glucans.   |
|                       | Beta-glucans consist of a backbone of $\beta$ -1-3-linked glucose residues that are branched by $\beta$ -1-6-linkages, to which chitin and mannoproteins are linked b $\beta$ -1-4-bonds.  |
|                       | Beta-glucans are isolated from yeast Saccharomyces cerevisiae.   |
|                       | The tertiary structure of the glucan cell wall of <i>Saccharomyces cerevisiae</i> consists of chains of B-1,3-linked glucose residues, branched by B-1,6-linkage forming a backbone to which are linked chitin via B-1,4- bonds, B-1,6-glucans and some mannoproteins. |
|                       | This novel food is available in three different forms: soluble, insoluble and insoluble in water, but dispersible in many liquid matrices.   |
